I think Quark will smash Calamus, but I do agree with Xavier.
It is a logic fallacy to say something is inherently better
just because millions use it, or because it's more expensive
or what have you.

But like I said though, I would expect Quark to beat Calamus SL
big time :-) (has to be proven though).

2266. Why is Calamus SL worse than Quark?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-07 01:20:22 UTC
From: ac382@FreeNet.Carleton.CA
Message-ID: <CpErpz.FrA@freenet.carleton.ca>
Source record: 17108

Or to put it another way, in what way is Quark express so much better than Calamus SL? SL is completely modular and seems to have a module to do just about anything you want.... I've never used Quark but I find it hard to believe that it is as good as some people would have me believe.
Anyone?

2267. Atari Computers

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-07 02:22:23 UTC
From: anna@wam.umd.edu
Message-ID: <2qeu0v$a9h@cville-srv.wam.umd.edu>
Source record: 17109

Hi!

I have been reading this group for a while, just kind
of observing what people talk about (or don't talk about,
as the case may be...)

And, I was wondering if perhaps people could begin
discussing, or post, a list of the computers Atari
has made with relevant specifications. I am interested
in learning about what exactly was produced (including
peripherals), and if the equipment can still be found today.

Posts to this group in response might actually mean
that this group will talk about more than atari vs.
mac vs. ibm vs. commodore vs. sinclap vs the world...
<grin>

Thanks,

Anna Winkler

Why would UK A500 owners switch over to the STE? That would be a step back down. Mac system prices in the UK are on par with the Amiga and ST. Atari's window of opportunity is gone.

I worship the Mac, I think not. The Mac fills my needs for now and if something
came along later, than i would switch. It's users like you who worship and
bash people for no selecting an Atari. I have pointed out there are better
alternatives and also try to counter the lies, and half truths about the Mac.

Atari Advocacy is to defend and attack Atari computers. Thats what it saids on my newsgroup header.

As for the Jaguar saving the computer line, don't count on it. I suggest you read carefuly Atari's last earnings press release. Atari is done with the computer line. no more new models and support.

Sega and Nintendo are multinational corporations who are able to adapt
worldwide at the same time. You know, to be able to walk and chew at the same
time. I doubt that Atari can compete because the company is too slow of
getting jags out in sufficient quantity. Sega and nintendo are billion dollar
companies that will steam roll Atari with enough product and marketing dollars.
THAT IS A FACT, ACCEPT IT...

Actually, I doubt any UK Amiga owners who are planning to switch machines woul go
for an Atari OR a Mac. They're more likely to get something like an
Archimedes/RISC PC.

Don't worship the Mac? You sure the hell act like you do. Otherwise,
why would you go thru so much trouble to prove that the Mac is superior
to everything else. And as for platform bashing, you have no equal; not
even Marc Barrett is in your league, much less anyone in this newsgroup.
As for bashing people for not selecting an Atari, neither me nor Steve
(the people you are replying to) is an Atari fanatic, much less bashers
of non-Atari buyers (like you are of non-Mac buyers).

I've said this before and I'll say ti again: GET A LIFE!!

>accepted by the masses.

In general a very good post, but I must disagree with your reasoning in
this paragraph. If I read it right, you're essentially saying that the
best product is the one that wins out in the marketplace. However, in
many cases (in fact, perhaps in most cases) that is not true. Do you
think that MS-DOS is the best operating system out there? That IS what
was chosen by the vast majority of computer users; who cares if its
lousy <MUCH SARCASM>. How about VHS vs Beta (I know little about home
video stuff, but I have read that Beta was superior to VHS in many places).
How about Windows vs. OS/2? How about the TRS-80 (YUCK), the #1 computer
in the grammar school market in the easly 80's? Being good helps, but
in order for a product to become successful it also needs good marketing,
(usually) the backing of big companies, and lots of software.

Thomas H. Trauth <trautt@magritte.its.rpi.edu> wrote:
>In general a very good post, but I must disagree with your reasoning in
>this paragraph. If I read it right, you're essentially saying that the
>best product is the one that wins out in the marketplace.

It almost always does. The problem is, people have a tendency
to confuse the technological sophistication (the "oh-ah" factor)
of a product with its suitability in a market. They don't understand
why the "best" product didn't take over the market and an
"obviously inferior" product did because they've misapplied the
values.

Take this example:

>However, in
>many cases (in fact, perhaps in most cases) that is not true. Do you
>think that MS-DOS is the best operating system out there?

This is a loaded question. In fact, MS-DOS *was* the *best*
operating system out there for the IBM PC when it was released.
Shortly after, CP/M-86 followed, and flopped, because it *was not*
the best operating system available. The UCSD P-System was
available, and flopped. There was even a Unix for the 8088 but it,
too, flopped. IBM's TopView flopped. Gem flopped. MS-Windows 1.0
flopped.

Why? Because the target market was a =< 640k 4.77MHz 8088-class PC
with CGA graphics.

One can fantasize about what would have been by theorizing about
what it would have been like if MS had worked on a pre-emptive
but shared-memory OS for the 16k (64k soon followed) 8088 IBM PC,
but this didn't happen, and in fact, probably wouldn't have worked
out.

The first potentially successful replacement for didn't arrive
until OS/2 2.0 shipped. 1.3 and 1.2 still had significant
compatibility problems, and running DOS apps is a required feature
in the x86 PC market. Put simply, if one didn't need to run DOS
apps, then one didn't buy an x86. When 2.0 shipped, however, IBM
had flubbed up the memory and CPU requirements by foisting off the
HUGE WorkPlace Shell onto the system instead of shipping with the
old shell from 1.3. The stability also wasn't there--DOS almost
never crashes, yet DOS apps running on OS/2 2.0 could leave the
user seeing crashes far, far more often than he was used to. So,

again, DOS was the best solution.

BTW: If you're wondering why Windows succeeded and OS/2 1.x did not,
consider this point: Windows inherited every DOS device driver. That,
combined with the lower resource requirements and the overall
smoothness of the product _in the eyes of new users_, is why Windows
took off in version 3.

>That IS what
>was chosen by the vast majority of computer users; who cares if its
>lousy <MUCH SARCASM>. How about VHS vs Beta (I know little about home
>video stuff, but I have read that Beta was superior to VHS in many places).

Indeed. And Sony ruined Beta's chances for success through
a program of mispricing, overcharging for licenses, and failure
to drum up wide-market support. Beta failed because it deserved
to fail--VHS delivered what the market wanted, and became the standard
for more than 12 years so far. Pioneer also premiered the LaserDisc
in 1980, which was superior to both VHS and Beta, but it was missing
a key feature that got it booted from the market.

>How about Windows vs. OS/2?

See above.

>How about the TRS-80 (YUCK), the #1 computer
>in the grammar school market in the easly 80's?

Was the Commodore 64 followed closely by the various Apple II systems.

> Being good helps, but
>in order for a product to become successful it also needs good marketing,
>(usually) the backing of big companies, and lots of software.

There's more to marketing than advertising. The first part of
marketing is delivering a product that can actually sell. If you
don't, no amount of advertising will make it succeed. You pointed out
two of the most classic examples yourself: DOS and OS/2.

[Discussion about DOS, Windows, OS/2, VHS, TRS-80, etc. deleted]

You're right, but even the best product available by your definition isn't necessarily the most commercially accepted one. Say product X is twice as good as product Y (in tech. sophistication, service, availability, software, etc.) but the company making product Y is ten times better at advertising than the company making X? There is a very good chance that Y will be much more successful than product X. You can never underestimate the power of effective advertising. You must remember that people, inspite of what is taught in introductory economics classes, do not necessarily act rationally (do the optimal things). They will not necessarily buy the product that will be best for them. This is especially true if they are led astray by clever advertising. True, the most whiz-bang product is not necessarily the best one (and often isn't) but the most commercially successful product isn't necessarily the best (your definition) either. After all, people are far from perfect.

<Sinclap's inquiry to Jag's national rollout>
Yup, it will be "real soon now." :-) In the meantime ST Format has reported sales of over 100,000 Jags in the States. This with only 5 games. The summer should be the Jag rollout with much more games (including AvP of course). Oh, also, DHGF announced that Mortal Kombat II will be released on the Jag at the same time as on the Genesis and the Nintendo. Have you also read the announcement that Sigma will be putting the Jag on a PC card? Looks interesting.
Oh, Pete, what frustration have you experienced owning an Atari product.... the Lynx? SRP on many Lynx games are now $15 and $20. Order direct from Atari.

That depends which A500 you are talking about. I heard there were two
types of A500 released, one before the A1000 and one after. As for the
window of opportunity well.... Atari's main market competitor is gone,
it really does not make sense to say that this means atari's chances are
less at succeeding. Like REALLY....

Well, I think ST Format is wrong. Atari may have SHIPPED
110,000 Jags in the states but I don't think they have sold all
of them. They have sold very well, but I don't think they have cleaned
out their entire supply for the quarter. They plan on selling 500,000
by year's end and I think they will achieve that. It's a nice system.

Then I suggest you start reading what I'm writing rather than
interpreting it in some offhand way. Personally, I don't consider things
like lack of support from Atari or any major third-party company to
be an insignificant point. Significant points, IMO, include things like
support, architecture, ease-of-use, convenience, etc. Insignificant
points consist of things like floppy drive buttons, keyboard feel, mouse
feel, the color of the machine, etc.

Timothy didn't write that; I did. Yo, Richard, get with the program, eh?
This is the second message so far that you claim that one person said
something when, in fact, another person did. And people wonder why I get
so aggravated when people accuse me of stating things which I didn't say...

True; I made that point a long time ago.

>Blame Atari for lack of marketing, not DMC for a poor product.

I *do* blame Atari for lack of marketing. And I never said Calamus was a poor product. I said that Calamus can't compete with established midrange and high-end programs like PageMaker and XPress, even if they WEREN'T already established. Calamus is an excellent product in its niche, and its niche is low-end and some midrange DTP tasks -- in my and many other professional opinions.

>I have heard many stories of people getting the job done better
>and faster with Atari DTP systems than with Mac DTP systems.

So have I, mainly from Atari fanatics. You hear that story *very* rarely in the high-end professional field.

>The reason I don't hear the other side of the story is probably
>because of the fact I mentioned- Mac users haven't heard
>about Atari systems. However, people that are earning livings
>with DTP on the Atari all seem to agree that Calamus SL is just
>as good, if not better, than DTP packages on other platforms.

Percentage-wise and numerically, I'd be willing to bet that the amount of people making a living on DTP with an Atari is extraordinarily small, small enough to be virtually nonexistant. I've encountered people in the DTP field who now work on Macs and PCs, and all but two that I can recall had good things to say about Calamus -- as a lower-spectrum product. Which has been my point all along.
I'm not saying that it's *impossible* to do high-end things on Calamus. I'm saying that it's far easier to do it on something like XPress. The tools for color handling, screening, working with other high-end tools, etc simply don't exist on the ST. If Atari were a major, or even vaguely significant, player in the DTP field, you'd have companies like Adobe releasing their font library for it. Right now, the two biggest players in DTP are the Mac and PC, with RISC-based workstations trailing right behind. Adobe (as an example) markets their fonts for Mac and PC, and the most popular ones get ported to the workstations.

>Steve, could it be that you just prefer Quark on a personal level
>and that it has nothing to do with the power of Calamus SL? I

>mean, what is it on Quark that you use that you don't think
>can be done in Calamus SL? We should name some features and see
>if they are supported by these packages. Just a thought....

Personally, yes, I prefer Quark. Professionally - where you MUST be objective about your work - I also prefer Quark. As do thousands upon thousands of other users.
Take a DTP "suite" of programs on the Atari (a DTP program, a PostScript drawing program, and an image retouching program -- standard fare for DTP work) and compare them to a common suite of Mac programs (say, QuarkXPress, Adobe Illustrator, and Adobe Photoshop). You *CAN NOT* produce the same type of work, with the same quality, in the same amount of time on the Atari system. The Mac (or PC, for that matter) system is much more tightly woven together. Want a custom halftone screen on that photograph? No problem -- and XPress will accomodate it for final printing. Want to do something special with that headline, maybe add some sort of photographic effect? No problem.
Believe me, I've tried. I used to work at a print shop with three other people doing DTP and we had a Mac, a PC, and an Atari TT. We had a reasonable compliment of programs for each; in theory, they all could do the same stuff. In practice, they couldn't. *Unless you've actually worked with all three systems, side by side, you have absolutely no idea what I'm talking about.* I could tell you 'till I'm blue in the face (and I'm getting there) about how impossible and/or damned inconvenient some things are to do on the Atari but I don't think it would do any good, as I continually find myself faced with "oh yeah?" posts from yourself and many others. People who, for all intents and purposes, have little experience in the professional field with all of the major players.

Aside from myself, is there ANYONE here who has been making a living in DTP for the past six years or so? Who has logged more hours at QuarkXPress and Photoshop than behind the wheel of my car? THAT is the sort of person who might understand what I'm getting at. Someone who uses DTP for the occasional flyer or a two-color prochure hasn't got a clue.

>In general a very good post, but I must disagree with your reasoning in
>this paragraph. If I read it right, you're essentially saying that the
>best product is the one that wins out in the marketplace. However, in
>many cases (in fact, perhaps in most cases) that is not true. Do you

In many cases, you're right. It's NOT true. This case, however, is one of the (few?) cases where the superior product IS the one that wins in the marketplace.
FTR, my feeling is that the best product isn't always the one that wins out in the marketplace. However, the marketplace can give a general feel to what's better than the competition. If you have 10,000,000 people buying Product A and 100 people buying Product B, you can (IMO) be reasonably sure that Product A is a better product.

>think that MS-DOS is the best operating system out there? That IS what

No, but it's the cheapest (in general). Fifteen year old architecture does tend to come pretty cheap in the marketplace, and people will buy a machine that does what they want for less money. Most home computers (PCs) are bought for light duty -- word processing, education, etc -- where an inexpensive machine will work fine. And that machine is usually the PC.

>was chosen by the vast majority of computer users; who cares if its
>lousy <MUCH SARCASM>. How about VHS vs Beta (I know little about home
>video stuff, but I have read that Beta was superior to VHS in many places).

It is. VHS is cheaper, however, and for most people, the difference in video between the two systems isn't worth the price jump. Pay $250 for a VHS VCR or $400 for a Beta VCR; the Beta gives a slightly better picture, but in most people's opinions, not a $150-better picture. (Beta, btw, was a proprietary format owned by one company, Sony, much like the Apple OS is owned by one company, whereas the VHS format is a "public" format, much like the PC's architecture is a "generic" architecture.)

>How about Windows vs. OS/2? How about the TRS-80 (YUCK), the #1 computer
>in the grammar school market in the easly 80's? Being good helps, but
>in order for a product to become successful it also needs good marketing,
>(usually) the backing of big companies, and lots of software.

IMO, OS/2 is better. Windows (until NT) requires less overhead to run -- which makes it the cheaper OS that does things similarly to OS/2. When the Trash-80 came out, that was *almost* the only thing around, so it doesn't count. (Did it ever?) ;)
Being good DOES help. Being CHEAP helps a lot more. Being BOTH is ideal,

and not very many companies have that. Getting the word out helps the most. Atari was cheap and good, but they failed to get the word out. PCs are cheap and good and the word is out. Macs were costly and good; now they're cheap and good, and the word is getting out a lot more today than it ever was.

>* king of the Russians (in Civ)

Leave me mail about this. I got a friend who plays Civilization on his Amiga all day and I told him I'd hook you up with him for some Civilization talk. :)

>about anything you want.... I've never used Quark but I find it hard to
>believe that it is as good as some people would have me believe.
>Anyone?

XPress, at last count, has about two or three hundred XTensions ("modules") in the commercial, freeware and shareware markets to do literally *anything* from aligning text a certain way to add full drawing tools. Being modular isn't anything new; XPress was the first major program to introduce the concept, in fact, to the Mac community.

If you're into light DTP tasks and you already have the equipment, there's no reason for you to switch to XPress and a Mac (or a PC).

However, if you want to get into some more serious work, you'll want to move up. Calamus simply doesn't have the high-end power needed for many of today's compex jobs. Furthermore, even if you COULD do "XPress-like" stuff with Calamus, good luck trying to get Lino output for it. Most service bureaus handle PostScript output for Macs and PCs only and won't touch PostScript generated by anything else. (One place I worked at refused several customers who bought in PostScript files generated by Amigas and STs. When I asked the managers why, I was told - and shown - that the PostScript code is generally unreliable, causing the imagesetters to crash and/or do inexplicable things. I've also experienced this first-hand, when a customer - at another shop - handed me some Amiga-generated PostScript code. It was a nightmare. Incorrect fonts, poor and/or nonexistant trapping, bad images, random-seeming lines and patterns, destroyed kearning tables, etc was the result - and eight mages of output we had to basically force the customer to buy.)

>-Steve

Things like floppy drive buttons, keyboard feel, and mouse feel may
seem to be insignificant, but they are actually very important. You
see, "insignificant things" largely determine whether a person is
comfortable with a computer or not. A user won't be happy won't be
happy using the word processor, even if it's the greatest one in the
world, if they can't stand the keyboard. A user (especially on the
Mac) will go bonkers if they have trouble moving the mouse pointer
around. And as for floppy drive buttons (and I know this is an old
issue) it is inconvenient, for some users at least (like me :-)), to
not be able to simply press a button to eject the floppy disk when
they feel like ejecting it. I mean, what good is a VCR if the remote
sucks?

Does this mean that your points are so weak that only a person with a very select set of experiences would agree with you? That anyone with a different set of experiences is a jerk (oops, sorry. I mean hasn't got a clue)?

It seems to me you are presenting personal preference (*not* professional) as fact. And not getting away with it either.

How do we know that Atari won't go the same way as Commodore ? Their support for the machines is just as bad, along with a policy of "NO ADVERSTING", what makes them sure that the Jaguar will be a success ?

After all, the Jag. isn't availiable in the UK yet. Let's hope (if & went they) do ship it over here, they DON'T just sell in the specialised computer shops.

This should be the quote of the week in NewsWeek. Mac and PC users do not have
knowlege of their machines? ARE YOU CLUELESS? My boss spends his time
installing and maintaining networks, opening machines to install cards and
maintaining a PC network, install cards and configure as well as troubleshoot.
I suppose he does not have much knowlege, eh? What about Graphic designers who
have Quadra Towers with big SuperMac color technology. Again do they lack
knowlege? I suppose Atari users like yourself are in denial that there is much
better platform out there!!!!

The issue of the floppy drive - as well as other issues - can't be too
problematic considering the number of Macs that have been sold. I agree
with all of what you're saying, mind you; I just think that you're
placing a greater emphasis on "insignificants" than the majority of
others do. (others = consumers in general)

>PS: Is there any reason why the Mac can't have *both* software and manual

Nope. No such wishful thinking, I'm afraid, Tom. It was rumored (and, to an extent, still is) that the PowerMacs would have manual eject floppies. The first wave of PowerMacs are here and they have the traditional automatic eject drives. It's still rumored that future PowerMacs may have manual eject floppies, but that's unconfirmed.

Scott :-)

This has little to do with this particular newsgroup...I will continue
it on the list or on comp.sys.atari.st whatever you prefer.

Phoenix is an object rendering program and was already demonstrated in
version 1.0 in last years CT Atarifest, it supports Falcon resolutions
as well and FPU (Optional), it creates SPC, GIF or 24bit TGA files and
is a very fast object renderer.

Example files are on ftp.std.com in /pub/atari/Graphics/2DGraphics/TGA or
GIF. It also supports all other Atari ST/TT etc. platforms with
Graphic Boards and exists in version 2.0.

I believe Chris wanted to see how fast a Mac renderer compared to the
Phoenix renderer (version 2.0) in speed and quality of similar objects.

Cheers

Yat

>poor product. I said that Calamus can't compete with established midrange
>and high-end programs like PageMaker and XPress, even if they WEREN'T
>already established. Calamus is an excellent product in its niche, and
>its niche is low-end and some midrange DTP tasks -- in my and many other
>professional opinions.

Of people who have never used or seen it? What was the main reason for
Compo to distribute the Medusa T40 in your opinion? It costs 8000 DMs
in Germany, that's as much as an 840 AV Quadra. BUT it is much cheaper
than a DEC Alpha machine w/ Calamus NT and DTP experts on the CeBit
said it was just as fast. Not knowing about Calamus SLs professional
qualities doesn't make it a non-competitor to XPress or Pagemaker.
Or why do YOU think Linotype-Hell favoured a TT/Calamus combination
to be used with their machines?

>>I have heard many stories of people getting the job done better
>>and faster with Atari DTP systems than with Mac DTP systems.
>
>So have I, mainly from Atari fanatics. You hear that story *very* rarely
>in the high-end professional field.

Does the high-end professional field include German newspapers in your
opinion? For what reason has Calamus NT been developed...for the low-end
market? (Yeah, right, 25,000 DMs are low-end, for that is what a working
Calamus NT HW/SW package costs.) And NT is/was mainly a Calamus SL for
Windows NT (some modules are being changed currently).
You either don't have any idea what you are talking about, or you are
having a VERY limited insight into the European DTP market.

>small enough to be virtually nonexistant. I've encountered people in the
>DTP field who now work on Macs and PCs, and all but two that I
>can recall had good things to say about Calamus -- as a lower-spectrum
>product. Which has been my point all along.

Yawn shall I list all the places where one can go with a Calamus document
to have it printed in professional quality on a Linotype-Hell or Agfa?
There are three such places in Hamburg alone, about the same number one
can find in Munich or Berlin, and the number in the Ruhr area is very
high also.

>I'm not saying that it's *impossible* to do high-end things on Calamus.
>I'm saying that it's far easier to do it on something like XPress. The
>tools for color handling, screening, working with other high-end tools,

>etc simply don't exist on the ST. If Atari were a major, or even vaguely
>significant, player in the DTP field, you'd have companies like Adobe
>releasing their font library for it. Right now, the two biggest players
>in DTP are the Mac and PC, with RISC-based workstations trailing right
>behind. Adobe (as an example) markets their fonts for Mac and PC, and the

[rest of mindless, clueless babbling deleted]

A modest proposal: Visit Germany at the next ADAT, go there, look, and be
quiet. Or visit the CeBit and have a look at Calamus NT at the DMC stand.

Just because YOU don't know anything about the quality of Atari software
in the DTP area, this doesn't mean the quality is low.

Pete, sweety-pie, why don't you run along and play in the mud like the other
children?

>My boss spends his time
>installing and maintaining networks, opening machines to install cards and
>maintaining a PC network, install cards and configure as well as troubleshoot.

I spend my time networking Suns, PCs, Macs and a lot of other machines and,
to generalise from my experience, the Sun users were competant about most
of the aspects of their machines. PC users are semi-aware---driven by
cardmania---and Mac users are often completely ignorant ("Wassa serial port").
Amiga users and Atari users seem to invest a lot more in their machines. They
seem to thrive off hacking their machines.

>I suppose he does not have much knowlege, eh?

I couldn't comment on your boss, except to point out that he employs
you---which puts his judgement in question if not his knowledge.

BTW, does your boss sound average? I can imagine you trying to claim that *all*
Mac users and PC users do the sort of work he does---but you would be deluded.

>I suppose Atari users like yourself are in denial that there is much
>better platform out there!!!!

Peter, sweety, I have more MIPS, MHz, Gigabytes, and colours-on-screen than I
really know what to do with---I am not tied to Ataris, Macs, PCs or any
other platform (well, maybe Sun:>) so don't go calling me a bigot. The
real bigot around here is you, wedded body and soul to your machine.
>

The whole discussion originated from the fact that the Atari line today would not be a logical choice to first time users. It's the sad truth fella, and you or any Atari worshipper can't do anything about it. I was just on the other Atari newsgroup and one posted prices for the Falcon. $1299 for a 4/80 is high and that does not include a monitor. I almost choked when i saw the $1899 config: YOU GOT TO BE KIDDING! Anyone say a $1599 PowerMac 6100 or $1899 for a 33 mhz 040 Quadra 650. I don't think Atari is selling much of that config. A Mac Quadra 660 AV, DSP equipped can be had for $1399(8/230). Oh I forgot that AV has an 040 and is so much cheaper than that $1899 FALCON....Boy this sounds like worshipping the Mac, at these prices who cares!!

Accept the fact that the Atari line is irrelevant and would be on borderline criminal to advocate one to a new user!!

Well, you're close. I've always contended that XPress was a professional level program while Calamus was not, so in that sense, yes, a person with serious, long-term professional experiences would agree with me. Those aren't the *only* people, though; I could name many, many single-user and/or casual users who prefer XPress to Calamus and other programs.
And, once again, I'd appreciate it if you didn't stick words into my mouth. I realize that some people here have no other way to make an argument than to claim that I said certain things; I was kind of hoping that you weren't one to stoop to such things.

>It seems to me you are presenting personal preference (*not* professional)
>as fact. And not getting away with it either.

Oooh, tough sounding guy. What the heck is THAT supposed to mean, "not getting away with it either"? Is some tough guy named Bruno Nine-Fingers gonna come knocking on my door?
I'm presenting personal AND professional preference. I use XPress to work, and I use XPress for personal projects. This point was made several times, long ago. Pay closer attention.

-Steve

Not going to bother with this drivel, since I made it perfectly clear
long ago that I wasn't interested in debating issues outside of the US. I
also point to you the statement made long ago that you apparently
ignored, where I explained the issue of Calamus in the professional field.

>than a DEC Alpha machine w/ Calamus NT and DTP experts on the CeBit
>said it was just as fast. Not knowing about Calamus SLs professional
>qualities doesn't make it a non-competitor to XPress or Pagemaker.

True. But knowing about Calamus' *lack* of professional qualities does.
As a DTP program standing alone, it might conceivably be a decent
alternative to XPress or PageMaker, assuming you can live with a total
lack of support from the rest of the professional community and a
deficiency of Adobe-quality-level PostScript fonts. However, the fact
remains that no ideal Calamus system exists that can compare with
conbinations like XPress/Photoshop/Illustrator. And even if Calamus were
10,000% better than XPress or PageMaker, it STILL wouldn't sell. Why?
Because there's no other software for the ST that could compare with
Photoshop and Illustrator.
You see, here's the deal that lots of people miss. Millions of
professionals use XPress, Photoshop, Illustrator, etc for professional
work. A few thousand use Calamus (and ???) for that sort of work. The
VAST majority shuns Calamus for one reason or another. Complain, argue,
whine, bitch, moan, groan, whatever all you want; the fact remains that
Calamus, for whatever reason, DOES NOT COMPARE to XPress or PageMaker. I
proclaim "whatever reason" to mainly consist of lack of high-level
features, support, and compatability. And lots of people agree with me.

>Or why do YOU think Linotype-Hell favoured a TT/Calamus combination
>to be used with their machines?

laugh
Perhaps, on the TT platform, Linotype-Hell favors Calamus, but that's
hardly a dedication to the rest of the world. L-H isn't saying, "if
you're going to use our imagesetters, you should use a TT and Calamus."
They're saying, "if you are going to use a TT with our imagesetter,
Calamus would probably be the best choice." That's an important
distinction, one which you might want to learn.

>Does the high-end professional field include German newspapers in your
>opinion? For what reason has Calamus NT been developed...for the low-end

>market? (Yeah, right, 25,000 DMs are low-end, for that is what a working

Get with the program. We're talking about the US market *ONLY*, remember?

>You either don't have any idea what you are talking about, or you are
>having a VERY limited insight into the European DTP market.

Or you failed to recognize the distinction of a STRICTLY-US discussion.
I'll place my money on that.

>*Yawn* shall I list all the places where one can go with a Calamus document
>to have it printed in professional quality on a Linotype-Hell or Agfa?
>There are three such places in Hamburg alone, about the same number one
>can find in Munich or Berlin, and the number in the Ruhr area is very
>high also.

Would that be Hamburg, West Virginia? Munich, Oregon? Berlin, Wisconsin?
YO! WAKE UP! UNITED STATES IS THE SUBJECT HERE!

>A modest proposal: Visit Germany at the next ADAT, go there, look, and be
>quiet. Or visit the CeBit and have a look at Calamus NT at the DMC stand.

A modest proposal: Pay attention to the entire conversation, especially
the BEGINNING where I *CLEARLY* stated that I wasn't interested in
discussing anything other than the US marketplace, before you leap in
with pointless drivel.

>Just because YOU don't know anything about the quality of Atari software
>in the DTP area, this doesn't mean the quality is low.

And just because YOU don't know what the topic of conversation is doesn't
mean that you know the answers.

Or maybe it does.

Ooh the vast majority shuns calamus. Right. They don't know it even exists.
What does it lack? What does it lack? What does it lack? Yes, I said that
three times so I'd hope you's hear. Are you afraid that your little perception
of Calamus as "not having professional features" is about to go up in smoke?

>Get with the program. We're talking about the US market *ONLY*, remember?

No wonder so many people hate us Americans. Obviously only US people know what DTP *really* is, and therefore are the only judges of what constitutes "professional quality" software. Sure, you're going to say that I'm putting words in your mouth, but you've dismissed Calamus as non-professional and then dismiss the evidence of Professional use of it extensively outside of the U.S. Since the progra's abilities do not change between countries, the only thing that can change is what constitutes professional. And since you have said that in the U.S. Calamus is not professional, the only logical explanation for the professional use of it outside of the U.S is that they do not know what Professional is, which is the response yopu made to Tim of Processor Direct, which is a US magazine using Calamus.

>Would that be Hamburg, West Virginia? Munich, Oregon? Berlin, Wisconsin?
>YO! WAKE UP! UNITED STATES IS THE SUBJECT HERE!

No, the subject is Calamus and your inability to accept that it is a professional calibre application which happens to be used extensively outside of our little country. These things always start out as "X software for the ST sucks" followed by "no it doesn't it sells in Europe" followed by your "We're only discussing US here!" rant. _YOU_ are the only one hiding behind the Stars & Stripes, my friend. I'm surprised that an Apple-loving maniac like you isn't hyped up over the whole "global village"-ness of Sys 7.1 and the Newton.

>A modest proposal: Pay attention to the entire conversation, especially
>the BEGINNING where I *CLEARLY* stated that I wasn't interested in
>discussing anything other than the US marketplace, before you leap in
>with pointless drivel.

You clearly say US after it is pointed out that you don't have a leg to stand on in terms of knowing the software, the real subject of the article. I really resent you using MY country as your shield.

>And just because YOU don't know what the topic of conversation is doesn't
>mean that you know the answers.

You're right. the topic is "Whatever Steve wants to twist to prove his non-existant point."

>Or maybe it does.

blah blah blah...

|> down. Mac system prices in the UK are on par with the Amiga and ST. Atari's
|> window of opportunity is gone.

Thats a good point. The STE is at least not better than the A500, and the
Falcon is (currently, anyway) probably too expensive too be interesting.
But after all, I fail to think of a former Amigoid buying a mac. It seems to
me like there is a special kind of people that are buying Amiga, Atari,
Archimedes machines. And its a kind of people that really *don't* want
to be associated with mainstream computers/anything.

I'm sure psychologists could do some really funky theories about whats going
on in the minds of some teen-age a[^p]* users.

IF the amiga is dead, then ofcourse the amigoids won't go selling their systems
immediately. The amiga market will probably continue for many years anyhow.
But when they (for some reason) find they need a new machine, my *guess* is
that this is what might happen:

- The game freaks will probably move on to the new powerful console
systems that are appearing.
- The coders don`t want to program intel chips, and the mac is too
little documented on the hardware level for them to be interesting.
Don't know where these may end up. Potential atari/archimedes buyers.
- MIDI application users will end up divided between atari/mac/pc's.
- The video application users will probably jump on the mac/pc bandwagon.
- Ditto for the DTP/WordProcessor/SpreadSheet users (if they exist ?)

Anyway, we don't know for sure that the amiga is dead, and I for one sure hopes
some company picks it up.

(LORDTHANATOS@DELPHI.COM) writes:

|> Would that be Hamburg, West Virginia? Munich, Oregon? Berlin, Wisconsin?
|> YO! WAKE UP! UNITED STATES IS THE SUBJECT HERE!

Yeah ?
So, when I am from Norway, my arguments wouldn't count, because this is
a US newsgroup only ???????????
Which only discusses matters of the united states. Like, who is currently
the president and stuff like that. Not.

GEEEEEEEEEEEEZ !!!!!!!!!!!!!!!!!!!!

Or, are you saying that *your* arguments are only viable in the US ?

The topic of this newsgroup is Atari stuff vs. the world.
The topic of this thread is/was "Enough of this. Please read."

|> A modest proposal: Pay attention to the entire conversation, especially
|> the BEGINNING where I *CLEARLY* stated that I wasn't interested in
|> discussing anything other than the US marketplace, before you leap in
|> with pointless drivel.

You said: Calamus SL is a low- to mid-end DTP product.
Thorsten Guenther says that Calamus SL is considered a high-end DTP product
in Germany.
Now you say that this argument isn't viable, because he is talking about
the German market. I just cannot see the difference between a product being
categorized as high-end in Germany or in US or wherever. As long as it is a
general opinion. In Germany, more people are aware of atari, so more people
are aware of calamus as well. Therefore more people have had the oppportunity
to work with or see calamus in action. Thus, in Germany the general feeling
is probably more objective. Now, we all know that atari is almost non-existant
in US. Fewer people have seen Calamus, but that has nothing to do with the
quality of the product.

Even if you stated that you weren't interested in discussing anything
other than the US marketplace.

Or maybe the outside world doesn't mean anything to you, as long as you
can sit down with your quark and "drivel", as you put it...
(flamebait)

Lets start a discussion about Norwegian salmon.
It is the best. There are no other countries producing even comparable

red fish. Oh, and if you are talking about other marketplaces than the Norwegian - your arguments doesn't count. Of course...

Even if calamus SL is superior to quark, and there are programs like photoshop et.al for the atari with the same or better quality. That doesn't necessarily makes this a wise investment,if one cannot get the support one need. Which is one of your good arguments.

But this has nothing to do with whether calamus is a high-end dtp product or not. And this is what this discussion is about now.

So I ask you.
What is it with quark express that makes it so much better than calamus sl ?
Does it produce higher resolution/more precision output ?
Is it faster ?
Does it have functionality that is non-existant in calamus ?
In that case, what - so that SL users has a chance to admit it, or even make you aware of these functions in calamus.

I ask. (after a lot of healthy flaming :-)

You answer, please.

Erling

The Claim you seem to be making and which some people are refuting
is that Calamus SL does not stand up to Quark as a high end DTP package.
Everyone knows that None of the Atari systems sell to well, especially in
the US. You keep coming back to 'well, I don't know anyone using SL so it
can't be any good can it? See? Noone is buying it and if it really was
good people would buy it etc..' You keep trying to pass off your opinion
as fact, wihtout any support besides the argument mentioned above.
And you have not pointed out any areas where the SL package is at all
lacking with the exception of accusations of lack of support etc...

WARNING *WARNING* *WARNING* *WARNING* *WARNING* *WARNING* *WARNING* *WARNING*

America has a software-feature draining vortex currupting and ruining applications that are shipped to that country. This vortex---which works in some way as yet undiscovered---means that only applications native to America and used by the people of America have any features left worth considering.

Scientists are baffled by this vortex, but professor Sergi Von Karkov is quoted to have said "Zis iz a desperate measure introduced to Zupport a collapzing bubble of logic---it vill not last long."

Software houses in Europe were last nigh seen to be rolling their eyes in disbelief.

End of newsflash.

An interesting developement of recent monthes has been the emergence of the 680x0 linux versions for Amiga, Atari & Mac. The interesting bit from the advocacy point of view is that they give BINARY compatibility to all those platforms - a 680x0 linux executable compiled for an Amiga will run quite happily on an Atari & vice versa......

Kernals are available NOW, complete systems can't be far away.

Anyone got an opinion, or shall we return to the usually scheduled flamewars ?

Of course, you do need at least a 68030 to run linux, so all you A1200 owners can bugger off for a start :)

Craig Graham.

Falcon030 owner - 16Bit Ram Bus, 32MHz CPU, but hey who cares? I can run Linux. Eat It Bad, any 68020 owners.........

There you go again... Over and over. "Atari users have not used anything else." "Atari users don't know anything about any other machines." "Atari users have never USED other machines."

Not only is that a gross generalization, but it's wrong for the majority of Atari users.

I will tell you again. My co-workers and I have used the other machines, and we DO know what they're like, rather well, in fact.

I suggest you get a grip on reality before you go spouting off foolishness like this.

We Atari users are not the ignorant fools that you make us out to be.

>three times so I'd hope you's hear. Are you afraid that your little perception
>of Calamus as "not having professional features" is about to go up in smoke?

Boy, are YOU insecure. I think the Atari community has found a pro-Atari
Sinclap, and you're it. I've made this statement before: It's not simply
my perception.

>No wonder so many people hate us Americans. Obviously only US people know
>what DTP *really* is, and therefore are the only judges of what constitutes
>"professional quality" software. Sure, you're going to say that I'm putting

No, you fool. It's *SIMPLY* because every Atari owner in the US is well
aware that the status of Atari is different (read: better) out of the US,
so generalizations made for the US market simply don't apply elsewhere.
Any idiot can see this, and this point was made WEEKS ago! Overseas, you
guys get the kind of support for Atari that we don't get here. Over here,
we get the kind of support from Apple and IBM that you guys get from
Atari. Plus there's advertising (nonexistant in the US, blatant
overseas), third-party support (nonexistant in the US, widespread

overseas), and platform stability (Atari is solid in the UK, a mere whisper here in the states). THAT'S WHY I MADE THAT DISTINCTION THAT YOU BRUSHED OFF SO CONVENIENTLY IN HOPES OF PUTTING SOME TWO-BIT DEFENSE TOGETHER. Get a grip, eh?

>words in your mouth, but you've dismissed Calamus as non-professional and then
>dismiss the evidence of Professional use of it extensively outside of the U.S.
>Since the progra's abilities do not change between countries, the only thing

No, I did not. I didn't mention it SINCE IT WASN'T A PART OF THE CONVERSATION.

>that can change is what constitutes professional. And since you have said
>that in the U.S. Calamus is not professional, the only logical explanation
>for the professional use of it outside of the U.S is that they do not know
>what Professional is, which is the response yopu made to Tim of Processor
>Direct, which is a US magazine using Calamus.

I did not say it wasn't professional. When you decide to get off your high horse, I'll point you to the dozens of messages I wrote pertaining to this.

>No, the subject is Calamus and your inability to accept that it is a
>professional calibre application which happens to be used extensively outside
>of our little country. These things always start out as "X software for the

No, the subject IS, AND HAS ALWAYS BEEN, Atari's position in the US marketplace. PERIOD. Get with it.

>ST sucks" followed by "no it doesn't it sells in Europe" followed by your
>"We're only discussing US here!" rant. _YOU_ are the only one hiding behind
>the Stars & Stripes, my friend. I'm surprised that an Apple-loving maniac
>like you isn't hyped up over the whole "global village"-ness of Sys 7.1
>and the Newton.

You poor, misguided person. I am not the only one "hiding", as you say. Aside from you, who jumped into this conversaion mid-stream and convinced yourself that you knew what the whole conversation was about, everyone else here was well aware of the locality of the topic of this post. YOU are the one at fault here.

>You clearly say US after it is pointed out that you don't have a leg to stand
>on in terms of knowing the software, the real subject of the article. I
>really resent you using MY country as your shield.

Laughable at best! I *CLEARLY* pointed out the US marketplace in the BEGINNING of this conversation, which you either missed, ignored, or simply brushed off. THE REAL SUBJECT OF THIS THREAD IS THE US MARKETPLACE. COPE!

>You're right. the topic is "Whatever Steve wants to twist to prove his non-
>existant point."

No, the topic is "Atari's Position in the US Marketplace." As far as this thread is concerned, it always was, and always will be.

There's no point in arguing DTP if you ignore most of the planet. The US is not the only country in the world. You must be stuck in your own little universe where Mac is king, and anything that differs does not fit with the contraints of your universe and therefore must be rejected.

>
>>than a DEC Alpha machine w/ Calamus NT and DTP experts on the CeBit

>deficiency of Adobe-quality-level PostScript fonts. However, the fact

Heloooooo! Adobe fonts are CRAP! <sigh> The designers of Calamus had a clue when they designed their font format. Adobe did not. We all know that Postscript is garbage. Why should their fonts be any better? I've never seen any font being rendered faster than a Calamus font, and they're professional-quality bezier-curve vector fonts.

You know what we should do? We should put together a poster of why Calamus SL is better than other DTP packages and submit the design to DMC for their use. If they had legal reasons why they couldn't use it, then we would do it ourselves. The Calamus vs. Everybodyelse poster would really help sales of Calamus, especially of one were put in every software store across the planet. :)

2352. A Tale of Concrete-Heads

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-11 17:04:26 UTC
From: lordthan@news.delphi.com
Message-ID: <2qr36q$8vf@news.delphi.com>
Source record: 16996

Well, so much for diplomacy, eh?

Several weeks ago, I started the "Enough of this" thread which, thanks to a couple of people (must notably Chris Sinclap, who turned the other threads into war zones too), has degenerated into yet another case of me reposting and reiterating statements I'd made several times in the past. Several times I'd pointed out that I was referring to the US marketplace only, yet I'm accused of double-talking myself out of a supposedly "cornered" situation.

I tire of this. I've found it almost completely impossible to have a conversation on this newsgroup, because almost every time I post something I get two dozen messages from people playing symantec games, nitpicking insignificancies, claiming that I said one thing when in fact I said nothing, etc. This newsgroup is *FILLED* with hostility, and I'm exhausted from trying (in vain) to talk to people who seem to have their heads filled with concrete rather than brain tissue.

Contrary to the accusations that have been made, I have indeed answered every question put to me. The newest accusation is that I haven't outlined what Calamus is lacking in professional features, when in reality I had posted an answer to this last week. It seems that if I answer a question and someone(s) misses my answer, I'm suddenly ducking the question. Hey folks, it's not my fault if you missed the answer, and it CERTAINLY doesn't brand me as a question-dodger.

In my initial "Enough of this" post, I had stated that I'd answer questions about the Mac, etc etc. Turns out that, against my intentions, this was taken as more fodder for the cannon. It's pointless and exhausting to talk to people with closed minds, moreso with people who love to play word games and read intentions into my posts.

So, that's it. After making this post, I'm unsubscribing from this newsgroup. My reasons, in no particular order, are as follows:

* A failure of certain people to recognize the fact that I was, and always have been, talking about Atari's position in the US marketplace.
* The hostile and threatening letters that I've received in my mailbox about some of the posts I made here. (It's rather distressing to see people threatening me with bodily harm *just* because I own a Mac. I'm afraid our society is doomed.)
* The uttery frustrating experience of having to answer the same question three, four, five or more times because people are more interested in reading alternate meanings into my posts rather than just the words and thoughts.
* The inability to locate more than three or four people on this

newsgroup who are able to maintain a civil, logical conversation. (You four know who you are; Chris Sinclap isn't one of them.)

That's it. I'm sure this message will spawn a flood of you-dick messages, but I'll be happy to let them slide since I won't be around to read them. (If there's one thing I learned from Chris Sinclap, it is indeed that ignorance truly does equal bliss, at least in this case.) In short, I really don't care.

There are, however, a few questions that I'd like answered. Since I'm accused so often of ducking a question, I present to you folks (and you, Chris) these questions which I haven't gotten an answer for. I don't expect any answers, and if any are posted, I won't see them anyway. So it's more of something for you to think about rather than a "real" question.

* How could I be a "Mac bigot" (or other less-than-civil accusation) when I own four or five Ataris - two of which are hooked up and running - and only one Mac?
* How could I be "unfairly biased" when I've owned and used Ataris since 1979? (It seems to me that I'm being lambasted for choosing a Mac over an Atari. Fanatical purists making this accusation I could understand, but it seems to me that because I thought about all available options INCLUDING the Atari before deciding on the Mac, I'm branded as some sort of traitor/idiot/jerk/etc. This is the only newsgroup that has ever lambasted me for *thinking*, and I believe that says something for the quality of some of the people here.)
* If I'm such a Mac lover/purist/fanatic/hugger/whatever, then why don't I sell every Atari (and other computer) that I own so I can buy more Mac stuff? For that matter, why did I just spend a couple hundred dollars on my *800XL* system rather than my Mac system?

The bottom line is that I'm running against the same group of three or four people who refuse to look at the whole picture, but instead look at individual thin slices of it and try to search out a meaning. It doesn't work that way, folks. It didn't work for Rodney King and it doesn't work here and it won't work in everyday life.

So, adiou, I wish most of you well, and the rest I'm impartial to. Flames can be routed through dev/null, for all I care. I'm off to greener pastures. Enjoy.

-Steve

Oop... you ALMOST answered the question there. Modularity is one of the nice features of Calamus, but it sucks for Quark. Anything you want to do with Quark stick another toolbar onto the desktop. You get enough of them, they get hard to find. Calamus just takes a few clicks to get anywhere.

>
>If you're into light DTP tasks and you already have the equipment,

What? 3DO puts the Jaguar to shame? You really DON'T know anything techical. The Jaguar has a set of 64-bit processors in it for doing all sorts of processing from graphics to sound, etc. All custom, high-performance chips designed by Atari.... then at the last minute, they threw in a 68000 just in case someone wanted it there.

3DO is a 32 bit machine with half the capabilityies, and, for the average game, less then half the processing speed.

And you say that it puts the Jaguar to shame?

110,000 sold in a eight month period is a flop. Atari needs to sell at least
two million a year to be profitable. Selling 500,000 will not cut it. When
Nintendo and Sega come out with their new generation of systems, I do not see
where the Jagauar fits in. Hell Apple sold 145,000 PowerMacs in a two week
period!

If Atari has stated that they hope to sell 500,000 in a year, that is obviously what they expect. They've said time and again that they are in no hurry and are trying to do the Jaguar "right", as this is their last chance. I'm sure that they would love to sell 2 million machines this year, but that may not be possible until they get back on their feet.

The Nintendo and Sega machines won't be a factor until the xmas season in 1995, allowing Atari (and the 3DO folks) plenty of time to establish a base. Only time will tell if they will be able to do this, but they do have a window of opportunity before the "big boys" have their machines ready.

As for the PowerMacs selling well, that's wonderful, but what in the world does that have to do with the Jaguar? Are you so crazy as to see these vastly different platforms as competition for one another? Wow, you really have lost it...

Atari has stated that they will sell 500,000 Jags because this is how many chips they can get for 'em. So, what you're saying is, if Atari meets the goal they set, then they are failing? Good reasoning. I suppose you really know the exact number of Jags Atari needs to sell to be profitable? Right. Atari is going to claim to expect profibility by 3rd or 4th quarter of this year knowing that they can't possibly achieve it? That'd be a wise move. I think you're overlooking cartridge sales. Also, with a user base of 500,000 units and a good game library the Jag will be tough to ignore in the marketplace.

Peter, there's nothing wrong with the price of an falcon or any other Atari
machine. The problem is the support. Look at the Amiga, and you'll see what
i mean. The Amiga didn't sell because it was cheap, it sold because it was
supported from the start. And for evey Amiga sold, Commendore would have to
do even less to sell it. (Infact, Amiga sold itselfe because of the support).

Now if the Falcon and the rest of the Atari machines had the same support,
people would care less about the price. Today noone wants to travel from one
end to another of an country, just to buy or see computer software. This is the
situation with Atari. Like the Amiga, the PC's seems to get the same attention. No
matter what is release today, it's released for PC's first. (The Amiga has starten
to fall btw.). As i have no interest in Mac's, i would not make any comments about
it, but i think it's simular to the Amiga situation, although i have a feeling
most Mac's are beeing used for education and schools, right ?

All this leaves me to say:
For newcomers to the computer world, we should recommend PC's. Not because of it's
abilities or it's price, but because of it's support.
My problem is, i have worked with Pc's, Amiga's and Atari's (alittle Mac too), and
i find the Atari as the best recommendation because of it's abilities, but unfortunatly
not because of it's price and support.

The question is, what _do_ we recommend to newcomers, and why do we recommend it.
Any of the above machines can/will give the newcomer problems, not matter what we
do. You would probably recommend a Mac. I would recommend an Atari. The person
will choose whatever suits him best, after having some experience

Wow is this the only fault you can find on the Mac? I have disk e, it's in the menu finder. You poor degenerate Atari worshipper knows that the end has come. Even Rickard finally realised it but won't admit it.

Source record: 17016

In article <2qpu8i$bgi@ugle.unit.no>, erlingh@idt.unit.no (Erling Henanger) writes:

So I ask you.
What is it with quark express that makes it so much better than calamus sl ?
Does it produce higher resolution/more precision output ?
Is it faster ?
Does it have functionality that is non-existant in calamus ?
In that case, what - so that SL users has a chance to admit it, or even make you aware of these functions in calamus.
==========

I think the idea here stems from:
1) Atari has a miniscule (<2%) market share in the US
2) Atari has a rather signifigant (at least 20% but a guess) market share in Europe.
3) Atari, and Atari developers are naturally more focussed on Europe
4) Atari, and Atari developers don't really support their products in the US very well
5) Most developers for other platforms are in the US
6) Most of the world's PCs (per capita too, except maybe for Singapore, etc) are in the US
7) Users of virtually any other DTP software find support in both other programs etc more available in the US
8) Since the market size in the US is larger, it is feasible for more people to start developing DTP software and add ons (modules, fonts, etc) in the US
9) US users, used to fairly easy support, will not tolerate the extra hassle of having to get transoceanic support.
10) Advertising also plays a factor.
11) Since Quark or Pagemaker have larger sales, it follows that they can be more responsive to technical changes in the US market (prevalence of DSPs, ubiquitousness of PostScript printers)

And, outside the list, aside from that new machine from Compo, the Atari performance has been, to say the least, lagging behind even Commodore. Although well written software can make the difference between a 16MHz 030 and a 32MHz 030, the performance offered by the 040 and even the PowerPc makes an insuperable difference.

>discussion from the outset, you probably would have seen it. Instead, you
>decided to jump in full-force without regard for topic.

I say again. This started out as Calamus vs Quark XPress until you brought
US versus Europe into it. We're talking applications, nto market share.

>No, maybe because it's because I *DID* answer this question, eons ago,
>and you (no surprise) missed it. I resent the arrogant bullshit you're
>attempting to put into my mouth, and I *EXPECT* an apology for this sort
>of shit.

Ooh. swearing. Proof that you're up against the wall. You never posted
anything about specific reasons and areas where Calamus is lacking. You lose.
Oh, and I'm so sorry you are such a fool.

>Boy, are YOU insecure. I think the Atari community has found a pro-Atari
>Sinclap, and you're it. I've made this statement before: It's not simply
>*my* perception.

I'ts not simply your perception? Prove it. Name articles and magazines
where Calamus SL is compared to other DTP programs and shunned. Facts, please.

>No, you fool. It's *SIMPLY* because every Atari owner in the US is well
>aware that the status of Atari is different (read: better) out of the US,
>so generalizations made for the US market simply don't apply elsewhere.
>Any idiot can see this, and this point was made WEEKS ago! Overseas, you
>guys get the kind of support for Atari that we don't get here. Over here,
>we get the kind of support from Apple and IBM that you guys get from
>Atari. Plus there's advertising (nonexistant in the US, blatant
>overseas), third-party support (nonexistant in the US, widespread
>overseas), and platform stability (Atari is solid in the UK, a mere
>whisper here in the states). THAT'S WHY I MADE THAT DISTINCTION THAT YOU
>BRUSHED OFF SO CONVENIENTLY IN HOPES OF PUTTING SOME TWO-BIT DEFENSE
>TOGETHER. Get a grip, eh?

Ooh. "you guys." Am I now European? Haver I not lived in the Bay Area
for my entire exitence? (21 years, BTW. Make whatever comments you like.)
Have I EVER had problems getting support for my Atari computer? The answer,

By the way, to all the above questions is "NO"

Advertising: Hey Tim, is it true that there are no ads in Processor Direct,
a U.S. produces Atari magazine?
Third Party Support: Hey Gribnif, COdeheads and the like: is it true that
you're really all Europeans and your US addresses are just facades? Oh, and
you don't really ever import English versions of software, do you?

>>words in your mouth, but you've dismissed Calamus as non-professional and then
>>dismiss the evidence of Professional use of it extensively outside of the U.S.
>>Since the progra's abilities do not change between countries, the only thing

>No, I did not. I didn't mention it SINCE IT WASN'T A PART OF THE
>CONVERSATION.

Not part of the conversation? "Calamus is not used professionally" "It is in
Europe." How is that not relevant? If it is used, it is used! Or
are you just going to change the subject now to

"Calamus is not widely used in professional circles in the US"

Hell, I'll agree to that, but that's not what you said.

>I did not say it wasn't professional. When you decide to get off your
>high horse, I'll point you to the dozens of messages I wrote pertaining
>to this.

Excuse me? You said it is not suitable for Professional level applications.
I equate professional to be High end use.

>No, the subject IS, AND HAS ALWAYS BEEN, Atari's position in the US
>marketplace. PERIOD. Get with it.

No. The subject is Calamus vs Quark. You are a sad case, truly.

>You poor, misguided person. I am not the only one "hiding", as you say.
>Aside from you, who jumped into this conversaion mid-stream and convinced
>yourself that you knew what the whole conversation was about, everyone
>else here was well aware of the locality of the topic of this post. YOU
>are the one at fault here.

Everyone? then why is everyone on the newsgroup agreeing with me, eh?
You seem to be the deluded one.

2372. Computer Choices

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-12 13:36:11 UTC
From: Ken Richardson <KCR103@psuvm.psu.edu>
Message-ID: <94132.093615KCR103@psuvm.psu.edu>
Source record: 17026

The discussion in this group has been interesting. I was kind of sad
to hear that Commodore bit the dust, because that leaves us all one
less alternative to Macintoshes and PCs. There has been talk about
how people will possibly convert to Ataris from Amigas. Well I doubt
it myself. When people convert to another computer platform, they
are most likely to choose the platform that has the most software available
or the best software available. Regardless of the quality of the
software, there is good and bad on every platform, computer platforms
with large up to date software libaries attract the most users, which
today is the PC. Macintoshes also have reached the critical mass in
software base to attract new users.
The other side of the coin is that there are two basic types of computer
users, the common consumer that we see today, and the less common
computer hacker that will write a program on his own if one does not
exist.
What will happen to the Amiga, will be waht has already happened to the
Apple][and Apple][gs. The Amiga market will constrict slowly but
surely as the consumers switch to mainstream markets leaving the core
of diehard hackers with a few consumers that support the hackers work.
The constriction can be reversed if new Amiga models are released by a third
party, but that does not happen very often. When Apple decided not to
release another Apple][gs, the market had to constrict. Whether or not
the Amigas stay up to date depends upon third party development alone.
It will be up to these companies to decide if they want to stay in a market
that will not grow. Companies that sell software to PCs and Macs and
Amigas will drop the Amiga, just like they dropped the Apple][gs. Do not
forget, that the Apple][line gave many of the present companies a start.
The decision they make is based on money, not loyalty to the computer line.
If the Atari market remains the same size, companies will probably not drop
software development, but if sales decrease or even stop, the same process
will occur again. (I don't know the status of the Atari marketplace.)

What it all comes down to is if the computer you own does the job you need.
In the mainstream, companies write software for next year's gee whiz computer.
In small markets such as the Apple][where faster computers are not being
made available, developers will write software for the computer that you own
already. This can actually be an advantage. If you had bought a PC instead
of your present Atari, Amiga, or Apple][gs, you would probably be suffering
with a 286 or 386SX and getting ready to buy another machine. Your Atari
probably works even better today than it did when you bought it because of
optimization of the operating system, etc. This has definitely been the case
with the Apple][gs and one can even buy a version of Unix for the machine.

So enjoy your 'obsolete' computer, because it really doesn't matter what
someone else thinks when you can do everything and more with it.

Ken

<post regarding image programs on the Atari>
Well, I have heard that Retouche is a very good program and that
Studio Photo shows quite a bit of promise (especially at $80).
The one card you forgot, I believe, is the Nova card from Lexicor.
It is well supported and cheap. If someone needed 24-bit graphics
on their TT then options are available. I don't really think your
points are valid....

There are quite a few image editing apps for the Falcon. Truepaint and Studio Photo are among them. They perform complex drawing and image-manipulation operations on up to 24 bit images. Studio Photo will do that even on an ST... you can manipulate high-resolution true-color images, except you won't be able to see them accurately on an ST's screen. On a Falcon, though, you see it all. Pick up Processor Direct issue #1 and read about Truepaint. We'll also be reviewing Studio Photo which is even more impressive.

Hahah. <ahem> Truetype fonts are even worse. You see, once upon a time, I read things and talk to people about fonts. I found out about various font structures, many of them laughable. Truetype and Adobe type 1 are adequate, but they're not exactly well designed.

Little do you seem to realize that the Mac has the craziest I/O structure ever
developed. All I/O MUST go through the CPU, which slows things down
tremendously. I've seen figures that showed a 16mhz 68030 Atari to have a
relative 9mhz speed improvement over a 16mhz 68030 Mac. I've SEEN the 16mhz
68030 Atari clobber a Quadra because the OS is just written better!

Atari CPU performance may 'lab behing' when do unfair comparisons like you do,
but the efficiency of the OS and I/O structure have ALWAYS been far superior.

** But once again, this has nothing to do with the CAPABILITIES of Calamus SL.

When are you going to answer the question?

GDOS? Does it even have a file format? Do you mean GEM Meta files? Well,
they're a popular enough vector image format, but that's beside the point.

No, we're talking Calamus here. Calamus SL always bypasses the postscript
interfaces to any imagesetter you connect it to, resulting in performance and
image quality improvements. And in Europe, Canada, and California, you can
take Calamus files on disk and have them printed just like Postscript files.

But again, I have torn apart Postscript. I've read quite a bit about it, and
while I couldn't sit down right now and write a postscript file by hand, I
know that I woulnd't WANT to because of the tremendous hassle involved.

The discussion was about page description languages. GDOS could be considered
to fall into that category, and GEM Metafiles are simply descriptions of
pages in GDOS/VDI commands. Metafiles are not limited to just vector images.

All this talk about Abode fonts and postscript being crap is all very well,
but it's industry standard, the same sort of thing as DOS.

We all know that DOS is a pretty naff system, but most people use it
because that's what everyone else uses - however crap it may be!

If a DTP package (whatever platform it's on) can't print postscript then
it's going to miss out from a lot of protental customers. Example being,
I have Calamus, I also have Timeworks - I use Timeworks most of the
time because it can output to a postscript printer. But which package
is the better of the two, it is Calamus, as long as you don't want
postscript output.

==========

Ah. Well, so they're adequate, and they *are* ubiquitous. I'm just saying that, like it or not, the whole world uses Type 1 fonts and until that, for whatever reason, changes Type 1 compatibility will be a major issue.

For example, ISDN lines have many advantages over POTS lines, but since POTS lines are ubiquitous many people have to use modems, which are clearly a kludge.

Besides, even if the format of a Type 1 font isn't maximally efficent, this does not prevent a person from designing a good typeface.

(Live from the VCC computer lab)
I wasn't going to make any more posts, sinCRAP, but I have to set some things
straight. I am NOT an Atari worshipper, fanatic, or even user! I am a PC
user and have been for over six years. I am still slightly interested in Atari
because of my days as an Atari 800 user, but I am currently much more inter-
ested in PC's. As for the lack of disk eject, I maintain that that is an
example of Apple hampering experienced users to pamper beginners, not of
superior design. And no, that is not the only reason why I don't like the
Mac! If you want to know other reasons why I don't like that sacred machine,
please read my other posts; I don't wish to restate them. AND I COULD CARE
LESS ABOUT THOSE G*D-DAMN BLACKBIRDS!!!

ONE of the problems with Adobe and Truetype fonts have nothing to do with the structure of the file, but the laziness of the designer. One of the requirements for Calamus fonts is that you have no overlapping regions. You CAN have overlapping regions, but then you can't do certain effects, and the imager slows down a lot. Adobe and Truetype fonts run rampant with overlapping regions (like in X's and T's, etc.). This makes it often impossible to do some effects, and they're always slower as a result. It takes a whole lot more processing to draw an outlined X properly if there is overlap than if there is not.

No, you see, Postscript was originally designed for interactive use. There are books that teach you to interactively draw things with a postscript program for Postscript 1.0 and 2.0. This was kinda neat, actually, but now that people aren't doing that any more but they're trying to use Postscript for automatic things. Things that were there to make things easier for the user made things difficult for people writing postscript drivers, and the human-readable design created a tremendous amount of overhead in both processing speed, transmittion time (to the printer or whatever), and storage requirements.

-> How do we know that Atari won't go the same way as Commodore ? Their
-> support for the machines is just as bad, along with a policy of "NO
-> ADVERSTING",
-> what makes them sure that the Jaguar will be a success ?

They are indeed advertising on tv here in the united states. There are only two problems that Atari needs to correct. #1 mass produce the jaguar. They seem not to have enough jags so that they can stay on the shelves instead people have to wait to buy one. #2 have a lot of software titles out. In the past 6 months they only released 4 game titles. However they have corrected that problem they've signed right now 100 developers instead of 30 6 months ago. 6 months ago they predicted 20-30 titles released by titles now it should be well over 90 by christmas. After they correc those two problems we shall see July-September and especially September-December how atari jag will turn out. If atari doesn't turn out well from now til December then there is no way their going to become dominant in the game market since by then sega will have their 32x system out and 3do will have surpased them in titles and mass production of the units.

Louis

I see what you mean. In defence of TrueType and Adobe fonts, however, one can
argue that overlapping regions are the fault of the font designer and not
necessarily the font format.

As one can infer from my message above, Calamus DOES do postscript. There are
printer drivers, and one of the modules will output PS and EPS files in
addition to all the other image formats it will produce.

|> Just out of interest, who is Marc Barrett and how has he attained suck
|> lengendary status as to rival sinclare?

Actually.. it is Sinclair the one who wants to vainly attempt to reach
Marc Barrett status.

Marc is a very old 'jerk' who has roamed comp.sys.amiga.misc since a
long long time. In fact, comp.sys.amiga.advocacy was created just because
people didn't want to read his drivel about C= and to keep him there, not
to really 'advocate' the Amiga.

So Marc, always critiziced, spread half-truths, some rumours that
later on turned out to be true and false (some true, some false), etc.
in an ever 'destructive' criticism style.

Lately, he has been a bit better though (better actually at making
more sense).

Sinclair usually does what? Quote a lot of text without editing it
and writing just a few lines? :-)

Marc came BEFORE - WAY BEFORE Sinclair... he just hangs in amiga
groups.

Hope that helps.

Trying to do the Jaguar right? Did not Atari state in the past that they would
do the ST, Lynx and Falcon right too? Can you elaborate on this? I realy
don't think that selling 500,000 will get them back on their feet.
>

True, but this is Atari we are talking about. Time and again Atari has many
opportunities that have been squandered again. As a Historian would say,
'History repeats itself'.. This time is no different.

> As for the PowerMacs selling well, that's wonderful, but what in

I was using this as an analogy to point out that Apple can manufacture more
sophisticated and complex products in quantity than Atari can on game consoles.

WellSkip I have not lost it. By the way, what about eating that floppy, since there will be no AAA...

> -scott tirrell

Atari thinks they well sell 500,000 but that's upto the market to decide. if
your a one product comapny and is depended upon your survival, than a game
console costing $250 retail would need higher sales than the Atari projections.
When Sega and Nintendo come out with their new game consoles, these firms will
have huge marketing resources at their disposal. Atari needs to sell millions
before these new consoles come to market inorder to build up their marketing
dollar reserves, because it will be a brutal fight..

Source record: 17052

I have a delema. I have always been an Atari person, but I am
not so sure on getting a Falcon now. I want one in the worst way, but
I may just get a Performa. Why?

The 4meg 85meg HD Falcon w/o monitor is roughly $1200. I can
get a Performa 600 4meg 160meg HD w/o monitor for $800. Apple software
is also abundant. I really want to stay with Atari, but common sense
tells me to get the Performa. I want people to mail me reasons to stay
with Atari.

I use the ST mainly for DTP. Yes, I have Calamus, so shut up! ;)

The reason to buy hardware is to run software. If the software you prefer is for the atari, buy an atari. If you've been living in the atari world, you already know about all the pitfalls of living with an out-of-the-mainstream computer. Bear in mind that whatever computer you buy today will be 'obsolete' in a couple of years, so it's not like a lifetime decision. Good luck.

2418. Information on SMS2 please

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-16 12:27:37 UTC
From: D.Corps@herts.ac.uk
Message-ID: <16867-769091245@sirius.herts.ac.uk>
Source record: 17055
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.advocacy,comp.sys.atari.st.tech,comp.sys.atari.st

Hi,
I've recently seen the adverts and read the STF article about
SMS2, the new operating-system-on-a-cartridge for Atari machines. I am
damn curious about it, and am also wondering why there haven't been any
articles about it on these newsgroups (of course, my feed might be a bit
slow).
I am very excited at the prospect of a proper multitasking O/S
with a proper windowing environment, and although the STF article and
review answered some questions, I have many more. Some of the most
pressing are below, but I would love to see a full discussion of SMS2.
Perhaps a new newsgroup is in order- comp.sys.atari.sms2?
QUESTIONS

What are the applications bundled with SMS2, if any?
What programming languages exist- LBASIC was mentioned, is there
a version of C in the pipeline?
How configurable is it?
How similar to Unix is the multitasking?
Does it support the standard ST/PC disk format (for floppy and
hard drives)?
PD software was mentioned- how much is there, and where could I
get it?
What is it like to use on a 1mb floppy drive system?
How much does it depend on boot disks and the like?
How can it be compatible with STFMs and STEs?

Duncan.

ObCommodore: C= liquidates... how ironic after all these years of
"competition". I hope the Amiga comes back, but I also hope
Atari & Acorn gain a little more credibility from this.

Date: 1994-05-16 14:28:11 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <2r7vtr$n67@dux.dundee.ac.uk>
Source record: 17081

Are there any multimedia authoring systems available for the Falcon?
If so are they compatible with the Apple Talk Network system (inside
the falcon)? Say can I link 3 machines together all sharing the one
HD?

Its either this or the Amiga!

Cheers (presently on Amiga possibly 1200)

Rod McCall

>addition to all the other image formats it will produce.

As one can infer from my message above, Calamus SL (as shipped to me a couple
of weeks ago) has NO support for PostScript. There is an OPTIONAL, extra $$,
driver that does a half-hearted job. (As I understand it, and feel free
to prove me wrong, it is only an output converter, ie does not add support
for EPS import, for PostScript fonts, for hinting Calamus fonts,...)

Hence, I still used PageStream this very morning for a job I would have
otherwise preferred to use Calamus for.

2421. Wasting Time In UK

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-16 16:08:51 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <2r85qj$sln@dux.dundee.ac.uk>
Source record: 17084

I understand that the FALCON is perhaps better than the Amiga A1200 in some respects but does this really mean the price has to be double that of an A1200? Considering Ataris present marketing clout here in the UK the A1200 will will hands down.

>with Atari.

My solution was to sit down with a Mac and a Falcon for a while and play with them. The Mac seemed rather sluggish, while the Atari was quick to respond. If you can handle the slow operating system, poor I/O structure, and a very hampered CPU, and you don't subscribe to a good Atari magazine that keeps you informed on all the gooa ATARI applications you could get instead, then the Mac would be a good choice for you. On the other hand, if you can handle a well-designed, quick machine with very good video, audio, and i/o hardware, and a little extra time to get the software you want, then the Atari will be the better choice.

Next issue of Processor Direct will have a nice review of That's Write 3, which appears to be a rather nice wordprocessor... finally.

Come on, lets give some advice and not hack the platform that you dislike.
Can't you recognize some valid points for the opposition?

Atari

Fast OS - Feels faster than the low-cost macs
Cheap Sofware - Relatively high-quality and low-cost
DSP - Can't get that in a low-cost mac, nice speed boost
Small OS - Takes less RAM

Mac

Support - There are more macs...
More Software - More software on the market including shareware
Better software - Higher-end software is more available (probably not
relevant due to the high-cost)
Faster processor- Event if the mac FEELS slower it will BE faster in many tasks
Bigger HD - No comment
OS Elegance - Many things are simpler to do on the mac and the OS has
many features.

Oh dear, following up to my own post. Heres a little memory
jogger, the advert that Furst Ltd. have been putting in the ST press for
the last couple of months.
The advert is (sadly) b/w and 1/4 page, probably they couldn't
afford much more than that. Lets hope SMS2, and Furst Ltd., get the
support they (seem to) deserve.
The text of the advert, excluding the phone number and address
(though I can post them if anyone wants) follows my .sig. And no, I
don't work for them, know them, drink with them, etc. They have simply
developed a product that has caught my interest.

TRUE MULTITASKING- THE SMS2 OPERATING SYSTEM

the DAWN of a NEW ERA

Furst Limited are pleased to annonuce the launch of a new
operating system for the Atari ST range of computers.
SMS2 turns even the lowliest of STs into a real time system
with workstation capabilities.

SMS2 is an object-oriented, network-ready operating system. It includes
many advanced features such as an intelligent graphics user interface, a
powerful hotkey system, a unique memory sharing system, inter-job
communications (eg. named pipes), re-directable I/O, built-in system
access programs.
SMS2 seems to be unusual in that you simply plug it into the cartridge
port of your ST, switch on and ten seconds later the system is ready for
use. There is no complex installation procedure and yet it is highly
configurable to suit your own particular needs.
SMS2 is supplied on PEROM (Programmable Erasable Read Only Memory) so
that any upgrades to the system software can be recorded onto the PEROMs
enabling your system to be easily updated.

Applications: SMS2 is not GEM or TOS compatible but is a distinct and
separate operating system, which provides a different form of computing.
There are already a number of commercial programs and a good range of PD

software which is available now and is SMS2 compatible.

FURST Limited

SMS2 is ready now for only <GBP>135.00 for the single user version.

2425. Converting 8 voice Amiga modules -> ST

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-16 19:47:09 UTC
From: kebl0011@black.ox.ac.uk
Message-ID: <1994May16.194709.27829@black.ox.ac.uk>
Source record: 17068

Does anyone know if there is a program to convert from the widely used 8 voice modules on the Amiga to a format that the Octalyser can use? The formats that I have come across so far are OctaMED, FTM and S3M, none of which can be read by this tracker.

Are there any other ST trackers that can use these formats?

Thanks for any information.

Andrew Sage

There is a review of SMS2 in a recent ST magazine - I think it was the last ST Format.

It does look like an impressive product, but then, many technologically innovative and impressive products are doomed to failure in this modern day, cash orientated world. Sad fact of life... :-(

SMS2 looks interesting, but for me, and many others, we simply cannot afford 160 odd quid on something that is interesting, rather than vital.

Of course, the price has to reflect developement and other costs, I realise that, but it is ultimately down to getting many people owning it, and I don't think that will happen (especially with all the mtasking software flying about at the moment - Mag!X is 60 pounds)

Let's be honest here. The Atari OS cannot compare in terms of features to System 7. TOS/MultiTOS does not have built-in support for file sharing and networking, multimedia such as Quicktime (which supports Photo-JPEG and Quicktime movies among other things), plug-and-play expansion, Publish and Subscribe, and Balloon Help (which despite what you say, can be useful).

Is the Mac OS slower? It can be. But the MAC OS is also more powerful than TOS, and the machines that Apple now makes are faster than the Falcon. Also keep in mind that while on paper TOS has features such as a universal font system, a clipboard and , such features are generally unsupported by most of the programs out there. In addition, there is little consistency between programs in terms of the user interface.

(By the way, could you expand on your statement that the Mac OS "gets in the way?")

This is not to say that Ataris are not nice machines. I owned Ataris for ten years (and I still do, although I now use a Mac as my primary machine and only do occasional stuff on my Mega STe) and they were great machines for their time, but I could not honestly recommend one to a new user -- even putting aside technology and price, they are simply not well-supported.

Yes, this is true. TOS does not have these features, and therefore the
developer must implement them himself in a manner which is not necessarily the
same as another application, which can lead to confusion for the users.
However, if space is a concern, keep in mind that most Atari programs are
smaller than Mac programs that do the same things.

>

It isn't the fault of the operating system that some of the apps don't support
certain features of the OS, and perhaps some programs just don't need to use
those features. Likewise, not all Mac programs take full advantage of the
Mac's OS.

>
>(By the way, could you expand on your statement that the Mac OS "gets in the
>way?")

That is to say, you can't do much of anything on a Mac without going through
the OS. Everything MUST be done though and OS call, and everything that does
goes through the OS then gives up the machine to all the other processes
running. If the program could use some OS functions without the multitasking
overhead, some tasks could have improved overall performance even while
multitasking. Also, just about anything you can do with the Mac through the
OS could be done faster, and it isn't, which 'gets in the way'.

>
>This is not to say that Ataris are not nice machines. I owned Ataris for ten

Ataris have _different_ strengths from Macs. I would not recomment a Mac over
an Atari nor the Atari necessarily over the Mac in some cases. If there is a
user who has absolutely no idea how to use a computer, then baloon help and
the Mac computer-knows-best interface will be perfect for them, not to
mention the fact that they won't be bothered by the sluggish user interface
and apps. On the other hand, if someone knows their way around a computer,
then I'd reccommend one or the other, depending on what they want to do. Macs
and Ataris excel in some of the same areas like MIDI sequencing and DTP, but I
feel that Ataris do a better job, so for those, I would recommend and Atari.
For graphics and audio processing, I would recommend an Atari. For
wordprocessing and plug-n-play networking, I would recommend a Mac. For a
person who doesn't care to figure out how to use a computer, I would recommend
a Mac. For someone who wants to have some fun programming a computer without
a hampering OS and limitations of hardware getting in their way, I would
recommend a Atari.

All Atari developers and hobbiests I've talked to who use other computers for
a living always tell me that they come home to their Atari to get away from
the other computers. They feel refreshed to use their Atari because it's
something different, and it's fun to develop software for. With this Atari, I
can actaully get something done or solve some problem without having to mess
with all the overhead that I would need to deal with on a Mac.

You claim to be the voice of reason, Steve, but you should stop talking
and start listening. You did not start this thread, and yur opinion of
how it began is irrelevant. Read the subject again: Enough of this.
Please read. This thread was started by someone who had had enough of
you and sinclap. Pete just might be able to retire from this news group
now. Stop insulting people. You are talking to the world.

Just because you don't want to talk about the world outside the US is NO
EXCUSE for your flaming people for having experiences outside your country
(and, I must admit, mine). You said yourself that Ataris are more common
in Europe than here, but you claim that is an excuse for EXCLUDING all those
who can't cite US examples from the discussion.

This is incredibly rude. You are on an international network, and whenever
someone asks you about features, you shout, "THIS IS THE USA!!!"

Grow up. You have sent another whining post that has said nothing new.
You have not answered the questions posed to you. (Again) You seldom
do. You just scream that you said it before.

And please do not use that word, "PROFESSIONAL" again unless you are
willing to tells what your professional credentials are. What do you
do as a professional in the publishing business? How long have you been
doing it? How many hours a day do you spend at it?

>
The Falcon is indeed over priced for a 16 mhz 030 machine. Support is a
important factor, but price is too. The Amiga sold well in the UK because it
is cheap and support was a little better. The Amiga has not been a very
well supported machine as far as the U.S. is concerned.

> Now if the Falcon and the rest of the Atari machines had the same support,

>

The Mac is similar to Amiga situation, i don't think so. If the falcon had
support today, an 040 one would be a reality. Macs are also being used for
other things besides education and schools. How about Home and business, where
Apple sold 500,000 Performas in the U.S. to that market. How about Quadras to
corporations as well as the new work servers.

> All this leaves me to say:
> For newcomers to the computer world, we should recommend PC's. Not because of it's

Actually, when the application has to implement features on it's own, it tends
to be larger. And OS consistency is fairly important.

>It isn't the fault of the operating system that some of the apps don't support
>certain features of the OS, and perhaps some programs just don't need to use
>those features. Likewise, not all Mac programs take full advantage of the
>Mac's OS.

True, but more mac programs take advantage of OS features. Far example, even the
crappiest freeware garbage supports clipboards and probably apple-events as
well.

>That is to say, you can't do much of anything on a Mac without going through
>the OS. Everything MUST be done though and OS call, and everything that does
>goes through the OS then gives up the machine to all the other processes

>OS could be done faster, and it isn't, which 'gets in the way'.

I don't really understant your statement, but it seems mainly to concern
programmers. And OS robustness is a feature of the Mac. If I'm making a
program I can count on the mac to do everything from hangle my events
to parse my numbers for me.

>Ataris have _different_ strengths from Macs. I would not recomment a Mac over

MIDI yes, DTP hmmmm

>For graphics and audio processing, I would recommend an Atari.

I don't think so. Graphics take CPU power and the mac definately has the CPU.
Audio is also good on the Mac. The new Non-AVs have 44KHz stereo (CD) and the
AVs have 48Khz stereo (DAT). The also come bundled with stereo mikes and good
CD-ROMS. They also have plug-and-play laser-disk access.

>For
>wordprocessing and plug-n-play networking, I would recommend a Mac. For a

IBM for wordprocessing. Mac for networking.

>person who doesn't care to figure out how to use a computer, I would recommend
>a Mac. For someone who wants to have some fun programming a computer without
>a hampering OS and limitations of hardware getting in their way, I would

I did send off for some more information - it does look impressive.

Will I buy it? Yes if the GUI was based on X11 (to make porting PD apps
easy) and it runs older TOS based programs (GEM would be even better).

But as far as I can make out, its a completly now OS with no backward
compatability nor compatable with other OS's.

I am considering buying an Atari Falcon, I have few questions:

(1) Can i connect an Amstrad CPC Monitor to it.

(2) Can anyone recommend a good comms program for it.

(3) A good word processor?

(4) RAM costs how much does a RAM expansion say 2/4mb cost.

Cheers

Rod

> demon on the horizon...
>

What would you do with an Atari speeding at 150MHz?

At the moment I wrote a program in Basic on my 8MHz STe. I gave a friend a copy
of the code and he translated it into Pascal. He now runs it on a 40MHz 386sx
and it takes double the time the ST took! :-)
======

A 150MHz TT or Falcon IMHO would blow up, it would be running so fast.

CEO file contents:
Hi, all !

I wouldn't want to start some unfounded rumors but...

Perhaps I've missed something here, but there's a discussion going on
in the french newsgroup fr.comp.sys.atari about a new atari machine.

Of what I've understood the machine has been officially presented to
developpers, it has Jaguar chips, plus a Power PC and is 100%
Falcon compatible. Sounds too good to be true doesn't it ? Perhaps it's just a
Jaguar card for Power PC machines, I dunno.

The info comes from a guy who knows some of these developpers who have seen 4
of these machines. The source seems ok to me.

Why haven't we seen this in c.s.a.s ? Is this just in Europe or France ?
Am I missing something here ? or am I being conned ? Are there still some guys
with brains at the Corp ? and does God exist ?

Anyone ?

You really should be asking these questions in comp.sys.atari.st. Here you'll
get a couple of Mac users telling you to dump Atari entirely and filling yout
head with lies like "There are no wordprocessors for your Atari." "There is
no software for Atari." "Ataris can't do this."

Ask these questions in a slightly less hostile environment.

Although I agree with your statement that the Falcon030 is a good bet,
I don't think that `poor i/o structure' matters or means anything to most
users. As you said elsewhere in your message, it's applications that count
(except to `hobbyists'). On that basis, the Mac is a better choice for
new users (IMO).

However, if Laura has a significant investment in apps for her ST, then
she will have to take into account the cost of replacing these if going
down the Mac route. That was the main reason I upgraded to a Falcon; I
couldn't afford to buy Mac equivalents to Cubase, PageStream, Vektor,
Calligrapher, Lattice, et al.

|> Will I buy it? Yes if the GUI was based on X11 (to make porting PD apps
|> easy) and it runs older TOS based programs (GEM would be even better).

The ST Format article does make passing mention of Unix programs
having been ported, but does not go into detail on the similarities/
differences between SMS2 and Unix. I doubt SMS2 could handle multiple
users and keep its promise re: speed.
I doubt old TOS stuff could run... but raw 68000 code might. It
depends on what traps do what (Duncan shows how limited his knowledge of
68000 and TOS is), I expect.

|> But as far as I can make out, its a completly now OS with no backward
|> compatability nor compatable with other OS's.

No great loss, if existing Unix software can be recompiled for
it. There has been mention of a C compiler, this seems to be a good step
forward. As long as authors use the O/S and the GUI correctly, SMS2 does
have similar facilities to Unix, and the compiler uses ANSI C, then SMS2
could well have a very bright future.
As for the other multitasking O/S... as I understand it, those
require a hard drive and are essentially similar to GEM/ TOS. Since SMS2
is cartridge based and does not appear to require anything more than a
floppy drive, this gives it a convenience I find very attractive.
Also, I've always found GEM to be a little limited as an
interface. This is probably why so much software ignores it. It is
simple and fairly intuitive, but it also seems a little clumsy and not
very 'open'.
If SMS2 is as easy to use as it seems, then an ST equipped with
SMS2 should have no trouble getting software. The problem is whether
someone will look and see the ST, a old architecture on the decline, or
SMS2, a powerful new top quality O/S. Linux is giving the PC a tad more
credibility, isn't it?

Duncan.

2448. **Mac software is cheap!!**

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-17 20:31:24 UTC
From: sinclap2954@cobra.uni.edu
Message-ID: <1994May17.153125.28049@cobra.uni.edu>
Source record: 16940

Well I was in my campus book store this morning. Pagemaker 4.0 can be bought for $53.25 and the 5.0 for $199. Very reasonable prices! Millions of students and faculty are eligible for these prices. Just wanted to break the myth that Mac software prices are to high.

Peter Sinclair-Day

|> Mac software prices are to high.

It's not a myth. They are very high- usually (not all of it) Consider
first that you are a student, and that price is a STUDENT price.

2nd: Some of Borland's and Microsofts best software products are at $99 (US)
in "normal ordinary stores" like Software Etc. in malls through the U.S. for
EVERYBODY, not just students.

3rd: For video and/or multimedia, Mac software price **IS NOT** cheap
in the least. $600-$800 US for Infini-D is kind of a joke. Same for $800
for Macromind Director.

Now, would you care to prove me wrong? I agree not all software is expensive,
but it is not cheap either, and in many areas it SIMPLY ISN'T.

FWIK SMS2 is an implementation of the Sinclair QL O/S. Much of what I've
read about it has been in 'QL World' magazine.

Assuming this is the case (and flame if I'm mixed up somewhere ;-)

> What programming languages exist- LBASIC was mentioned, is there
>a version of C in the pipeline?

There is a fairly good C compiler for the QL, but nothing that gets
anywhere close to GNU C or Lattice C

> How similar to Unix is the multitasking?

Not particularly. MiNT is closer IMHO

> Does it support the standard ST/PC disk format (for floppy and

I believe so, although I don't think this is the standard.

> PD software was mentioned- how much is there, and where could I

Well I assume they mean the *vast* quantity of QL PD ;-) There is not
really a lot out there.

> What is it like to use on a 1mb floppy drive system?

Should be very good. Its a lot more compact than TOS.

IMHO don't bother. I've had a bit of experience of standard QL QDOS
(which as I said I *believe* SMS2 to be an enchanced port off, and in most
ways it has no advantages over TOS/MiNT or MINIX. Its only advantage would
be its compactness and efficiency.

:-)

Roland.

I know that postscript is slow. Often printers that support postscript
are more expensive.
As a Calamus SL user I can get a simple printer and print with the same
quality you will if you had the same printer with postscript.

I don't like GDOS either. I prefer Calamus for my printouts. It is very
fast and simple to use.

Yeah, but it's too hard for you to translate to be able to quote
anything, right?

Let me guess, in two days, you'll post to fr.comp.sys.atari (if such a
group exists) saying there is a discussion in comp.sys.atari.st about
this fictitious machine!

Not laughing, yawning.

2454. Sigma's JagPC, SAFFIRE VR Engine and Reality Blaster

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-18 02:54:00 UTC
From: sysop@teaminfinity.com
Message-ID: <76.282.249.0N96642F@teaminfinity.com>
Source record: 16953

We think it is wonderful that Atari's JAG Chipset is coming to the PC
in an ISA board from Sigma Design !!

Now VR and Game developers the world over will get busy on an awesome
graphics powerhouse.

Question: Will the JAG PC have the entire chipset found in my Jag ?

Secondly: Since the Jag Chipset does 3D PolyGon Rendering so well
will the JAG PC be competition for the so called PC based
"Virtuality Blasters" coming out now ?

(Background: Future Vision Tech's SAPPFIRE board is
a VR Blaster that does many of the things the JAG does
Hardware Gourard shading, Z-buffering, A buffering
VGA/NTSC/PAL S-VHS output, CD DSP Sound.

Synthetic Images' REALITY BLASTER as they call it
does two channel 3D Stereo Video, Hard Z buffering,
Transperancy, and Lucency, onboard 3x3 antialiasing,
2,000 polys/frame @30 frames/sec 24 bit color, texture
maps, as well as LEEP (Howlett) Optical Distortion.
etc.

Question: How does the JAG Chipset compare/compete with
these ? Would you consider the JAG Chipset
a VR-BLASTER in its own right ? Can it handle
driving two seperate monitors for stereoscopic
3D video. Can the Jag handle LEEP (Howlett)
optical distortion.

If so, and priced in the SUB $500 range, it will
kill the likes of SAPPHIRE as they are priced over
$2000 a piece.

sysop@teaminfinity.com

A very rotten pile of BULL SHIT is looming ahead if we don't make
a stand and voice our opinions on what I am about to inform
everyone here on. I will apologize now for the EXTREME length
of what follows, but I feel it is necessary to preserve what
we now enjoy. This is not about the Jaguar, however we may
not be able to afford to discuss it if we don't do something
about it.

There is a very strong possibilty that in the very near future,
the mega communications giants are going to charge for every single
packet going in and out of Internet Network Access Points and high
speed backbones that they NOW control. The National Science Foundation
just awarded five big contracts giving them this control.

Groups such as this one will most likely shut down as the listservers
will no longer be able to afford to operate without in turn charging us
for their sevices. What do you think will then happen to the readership
here if we are charged for the priviledge of enjoying the jag list?
Most of us will probably be forced to unsubscribe. Those of you that
already pay AOL, Compuserve, Delphi, etc. for internet access will be charged
even more for that priviledge. Those of you that think your "by-the-character"
charges are high now, just you wait. Everyone who uses the internet
(everyone here included) should read this and reply as indicated.
I find it very appalling to think about large corporations fattening their
guts even more by charging you and I for every single packet of
(currently free) jaguar info, data, e-mail, mosaic request, etc.
If we don't voice now on this one folks, the information superhighway
will be obstructed with potholes and toll booths.

If you complain about the length of messages now, just think how
PISSED-OFF you will be if you have to pay for it (or pay more than you do now).

The following is long and very frightening. IT SHOULD SCARE YOU!!!
DO SOMETHING ABOUT IT!!

Please send this to everyone you know. The more people that respond,
the better our chances are that we can kill this thing.

I'm not going to sit back and watch it happen, I hope you don't either.

Just my $0.02. I may need the lousy $0.98 so I can send this e-mail out!

Scott Buennemeyer

Subject: Metered Usage of the Internet: JSN

Please forgive the mass mailing, but I feel this is a subject
which is of great importance to anyone who benefits from the
bountiful resources of the Internet.

A very bad storm is brooding on the horizon.

In the future, you might have to pay a charge for every E-mail
message you send or receive, every Usenet article you read,
every kilobyte of data you transfer with ftp, every hypertext
link you follow with NCSA Mosaic or Gopher...

Hopefully this frightens you as much as it does me.
But it will happen, unless YOU do something about it.

Please read the attached, fill out the requested info, and
mail it back to mike@essential.org. It also wouldn't hurt to
forward a copy of this to everyone you know on the Internet.

Thanks for your support.

TAXPAYER ASSETS PROJECT - INFORMATION POLICY NOTE
May 7, 1994

- Request for signatures for a letter to NSF opposing metered
pricing of Internet usage

- Please repost this request freely

The letter will be sent to Steve Wolff, the Director of
Networking and Communications for NSF. The purpose of the letter
is to express a number of user concerns about the future of
Internet pricing. NSF recently announced that is awarding five
key contracts to telephone companies to operate four Internet
"Network Access Points" (NAPs), and an NSF funded very high speed
backbone (vBNS). There have been a number of indications that
the telephone companies operating the NAPs will seek permission
from NSF to price NAPs services according to some measure of
Internet usage. The vBNS is expected to act as a testbed for new
Internet pricing and accounting schemes. The letter expresses
the view that metered pricing of Internet usage should be
avoided, and that NSF should ensure that the free flow of

information through Internet listserves and file server sites is preserved and enhanced.

Jamie Love, Taxpayer Assets Project (love@essential.org; but unable to answer mail until May 15). Until then, direct inquires to Michael Ward.

If you are willing to sign the letter, send the following information to Mike Ward of the Taxpayer Assets Project (mike@essential.org, fax: 202/234-5176; voice: 202/387-8030; P.O. Box 19367, Washington, DC 20036):

Names: _____
Title: _____ (Optional)
Affiliation: _____
(for purposes of identification only)
Address: _____
City; St, Zip _____
Email Address: _____
Voice: _____
for verification)

The letter follows:

Steve Wolff
Director
Division of Networking and Communications
National Science Foundation
1800 G Street
Washington, DC 20550

Dear Steve:

It is our understanding that the National Science Foundation (NSF) and other federal agencies are developing a new architecture for the Internet that will utilize four new Network Access Points (NAPs), which have been described as the new "cloverleaves" for the Internet. You have indicated that NSF is awarding contracts for four NAPs, which will be operated by telephone companies (Pac Bell, S.F.; Ameritech, Chicago; Sprint, NY; and MFS, Washington, DC). We further understand that NSF has selected MCI to operate its new very high speed backbone (vBNS) facility.

There is broad public interest in the outcome of the negotiations between NSF and the companies that will operate the NAPs and vBNS. We are writing to ask that NSF consider the following objectives in its negotiations with these five firms:

PRICING.

We are concerned about the future pricing systems for Internet access and usage. Many users pay fixed rates for Internet

connections, often based upon the bandwidth of the connection, and do not pay for network usage, such as the transfer of data using email, ftp, Gopher or Mosaic. It has been widely reported on certain Internet discussion groups, such as com-priv, that the operators of the NAPs are contemplating a system of usage based pricing.

We are very concerned about any movement toward usage based pricing on the Internet, and we are particularly concerned about the future of the Internet Listserves, which allow broad democratic discourse on a wide range of issues. We believe that the continued existence and enhancement of the Internet discussion groups and distribution lists is so important that any pricing scheme for the NAPs that would endanger or restrict their use should be rejected by the NSF.

It is important for NSF to recognize that the Internet is more than a network for scientific researchers or commercial transactions. It represents the most important new effort to expand democracy into a wide range of human endeavors. The open communication and the free flow of information have make government and private organizations more accountable, and allowed citizens to organize and debate the widest range of matters. Federal policy should be directed at expanding public access to the Internet, and it should reject efforts to introduce pricing schemes for Internet usage that would mimic commercial telephone networks or expensive private network services such as MCI mail.

To put this into perspective, NSF officials must consider how any pricing mechanisms will change the economics of hosting an Internet electronic mail discussion groups and distribution lists. Many of these discussion groups and lists are very large, such as Humanist, GIS-L, CNI-Copyright, PACS-L, CPSR-Announce or Com-Priv. It is not unusual for a popular Internet discussion group to have several thousand members, and send out more than 100,000 email messages per day. These discussion groups and distribution lists are the backbones of democratic discourse on the Internet, and it is doubtful that they would survive if metered pricing of electronic mail is introduced on the Internet.

Usage based pricing would also introduce a wide range of problems regarding the use of ftp, gopher and mosaic servers, since it conceivable that the persons who provide "free" information on servers would be asked to pay the costs of "sending" data to persons who request data. This would vastly increase the costs of operating a server site, and would likely eliminate many sources of data now "published" for free.

We are also concerned about the types of accounting mechanisms which may be developed or deployed to facilitate usage based pricing schemes., which raise a number of concerns about personal

privacy. Few Internet users are anxious to see a new system of "surveillance" that will allow the government or private data vendors to monitor and track individual usage of Information obtained from Internet listserves or fileserves.

ANTI-COMPETITIVE PRACTICES

We are also concerned about the potential for anti-competitive behavior by the firms that operate the NAPs. Since 1991 there have been a number of criticisms of ANS pricing practices, and concerns about issues such as price discrimination or preferential treatment are likely to become more important as the firms operating the NAPs become competitors of firms that must connect to the NAPs. We are particularly concerned about the announcements by PAC-Bell and Ameritech that they will enter the retail market for Internet services, since both firms were selected by NSF to operate NAPs. It is essential that the contracts signed by NSF include the strongest possible measures to insure that the operators of the NAPs do not unfairly discriminate against unaffiliated companies.

Recommendations:

As the Internet moves from the realm of the research community to a more vital part of the nation's information infrastructure, the NSF must ensure that its decisions reflect the needs and values of a much larger community.

1. The NSF contracts with the NAPs operators will include clauses that determine how the NAP services will be priced. It is important that NSF disclose and receive comment on all pricing proposals before they become final. NSF should create an online discussion list to facilitate public dialog on the pricing proposals, and NSF should identify its criteria for selecting a particular pricing mechanism, addressing the issue of how the pricing system will impact the Internet's role in facilitating democratic debate.

2. NSF should create a consumer advisory board which would include a broad cross section of consumer interests, including independent network service providers (NSPs), publishers of Internet discussion groups and distribution lists, academic networks, librarians, citizen groups and individual users. This advisory board should review a number of policy questions related to the operation of the Internet, including questions such as the NAP pricing, NAP operator disclosure of financial, technical and operational data, systems of Internet accounting which are being tested on the vBNS and other topics.

3. NSF should solicit public comment, though an online discussion group, of the types of safeguards against

anticompetitive behavior by the NAPs which should be
addressed in the NSF/NAPs contracts, and on issues such as
NAPs pricing and Internet accounting systems.

```
+-- This was written in a previous article by HALL B J...
|> There is a review of SMS2 in a recent ST magazine - I think it was the
|> last ST Format.

Yes, I know, and though it told me enough to get more interested
in SMS2 than in the disk based O/Ss, it left me with a lot of questions,
which is why I started this thread. Since then I've got a lot of info. from
the articles you have posted here, I've got more info.
But I've also found out about a *very* good article in the
upcoming June issue of ST Applications. You can get details of STA from
ST Club in Nottingham, phone 0602-455250 or fax 0602-455305. I don't
know how to call them from abroad, I've never been abroad and wanted to
phone someone in England before.
Lordy, all this makes me sound like a complete SMS2/ STA
advocate. I don't work for them or anything, I just like them. This is
not a sneaky attempt to stir up interest artificially, they deserve all
the interest they can get, IMHO.

Duncan (75% certain to save up and buy SMS2)

PS. I wonder if not supporting TOS disks is really a mistake... Perhaps
some kind soul could write ST File Exchange, or summat?

I would like some more info on the JagPC.

How much will it cost?

When will it come out?

How much will it cost to develop games for it?

What compatibility will it have with the Jaguar, How
will I plug in carts?

Any info would be extremely appreciated!

Salute,

David Clayton

Bzzt! One of the reasons I like PostScript is that I can get MUCH better quality of out my cheapo DeskJet 550c (as well as the ability to drive better printers). The GhostScript driver (v2.6.1) generates much better quality colour output (due to different dithering algorithms), than either the Calamus SL or PageStream HP 550c drivers.

So, I try to use PostScript even when the file will never see a true PostScript printer. That's why I'm not happy with Calamus SL; no PostScript.

I'd argue that this is a function of how well the programmer did his job, not necessarily the operating system. Wordflair II, for example, takes up about 400K on disk and will barely run decently with 1Mb of free memory. ClarisWorks on the Mac, for example, takes up 650K on disk, does everything Wordflair II does and **much** more, and runs fine in 1Mb of free memory. (Plus ClarisWorks isn't prone to random crashes like Wordflair.) Also keep in mind that Mac software is, in general, more sophisticated than Atari software.

>>Is the Mac OS slower? It can be. But the MAC OS is also more powerful than
>>TOS, and the machines that Apple now makes are faster than the Falcon. Also
>>keep in mind that while on paper TOS has features such as a universal font
>>system, a clipboard and , such features are generally unsupported by most of

>
>It isn't the fault of the operating system that some of the apps don't support
>certain features of the OS, and perhaps some programs just don't need to use
>those features.

That's true; it's not the fault of the OS. The problem is that many programs could benefit by using the standard Clipboard (I can't think of one program which couldn't!) and SpeedoGDOS. (I can't think of even ten programs which properly support SpeedoGDOS.) The problem is that no matter whose fault it is, the result is still the same -- a mess, and confusion for the user.

> Likewise, not all Mac programs take full advantage of the
>Mac's OS.

True, but there is still not the blatant disregard from OS programming guide-lines that seems only now to be coming to an end on the Atari. Not all Mac programs fully utilise the features they could, but they still come out ahead of Ataris in terms of uniformity and support of OS features. All programs (if appropriate) use the clipboard, multiple fonts, standard dialogues for file commands, etc.

>That is to say, you can't do much of anything on a Mac without going through

>OS could be done faster, and it isn't, which 'gets in the way'.

This is not entirely accurate. It is not true that EVERYTHING must be done
through an OS call, and anyway, using the OS to perform functions only makes
programs behave more uniformly. This is *not* a bad thing. I also take issue
with your statement that "just about anything you can do with the Mac through
the OS could be done faster." Unlike the Atari, there does not seem to be
a market for products such as Warp 9, NVDI, or Fatspeed...

>Ataris have _different_ strengths from Macs. I would not recomment a Mac over

>and apps.

You have not given any proof that the Mac's interface and applications are
sluggish. If anything, it's the Atari's interface and apps which are sluggish.
They run on old processors, and are not even optimised for those (hence the
need for software accelerators.) Needless to say, I do not agree with your
assessment. (How come people think that just because an interface is easy
to use, it is restrictive?)

>All Atari developers and hobbiests I've talked to who use other computers for

>something different, and it's fun to develop software for. With this Atari, I
>can actaully get something done or solve some problem without having to mess
>with all the overhead that I would need to deal with on a Mac.

That's the reason I have a Mac. I tired of my Atari, which was slow and
unsupported, didn't want to bother with clone boxes. It's a nice break from
the stupid Unix boxes I have to deal with every day.

Well an initial version of the TCPIP Faq (if you can really call it that) how about the Guide to Connecting your Atari to the Internet. At least a litle more accurate. ;) Well after some small amount of research and work I have come up with an initial version. I am certain that it does not contain everything it should, but I wanted to get it out for comments and suggestions. The current version is approx. 45K, I am going to send it to a.a.u.e., ftp.uni-kl.de, mic2.hensa.ac.uk and ftp.tu-clausthal.de. If you are unable to FTP then send me email and I will mail it to you.

Please feel free to make comments and suggestions. And pass it on to anyone who needs it.

-> The 4meg 85meg HD Falcon w/o monitor is roughly $1200. I can get a
-> Performa 600 4meg 160meg HD w/o monitor for $800. Apple software is
-> also abundant. I really want to stay with Atari, but common sense
-> tells me to get the Performa. I want people to mail me reasons to
-> stay with Atari.
->
-> I use the ST mainly for DTP. Yes, I have Calamus, so shut up! ;)

For a start, you havn't factored in the price of DTP software when you buy the Mac. Right there you're looking at a good $400 and up for a half decent DTP application to match the performance of Calamus SL -- or even Timeworks DTP. That brings the Performa up to $1200 MINIMUM. Then you have to figure that the Performa doesn't include both IDE and SCSI-2 hard disk ports, so you'd have to spend extra to get one or the other type dpeending on what the Performa comes with. And if it's SCSI-2, those controllers cost quite a bit. (Usually in the neighbourhood of $200 and up -- that's a Canadian price) Then there's the Falcon's DSP, which the Performa doesn't have. And since you already have Calamus for the ST, it makes sense that you'd actually be _saving_ money buy buying the Falcon, after all is said and done. Not to mention not having to give up any other pieces of software you already own.

Personally, I want a Falcon too, and I intend to get one. Apple doesn't do it for me, and neither does the PC.

-> Jaguar can do? I would love to get rid of my SB16 :) How much did
-> he say it was going to cost? What level of machine do you need to
-> install the Jaguar chipset (a 386 or higher would be formidable!!!)

The price of the Sigma Design's JagPC card is around $500 (SRP). It
allows you to play any Jaguar CD-ROM game, and in its spare time, acts
as a graphics accellerator and realtime MPEG board.

You need at least a Multimedia Level 2 (486+) machine to install it; it
plugs into any standard ISA bus.

Well depending on how comapatible SMS2 is with QDOS - there is already at least one good ST/PC disk reader for it.

Anyway IMHO ST/PC disk compatibilty is a must, if only as a way of getting source code files on for recompilation. The underlying file system can be something else - however FWIK, the QDOS one is pretty poor comapared to MINIXFS or even TOSFS.

Roland.

Saying that Mac programs are generally more sophistocated than Atari programs is an over generalization. I could just as easily say that most Atari programs are better written than Mac programs, in general.

Atari users like software accelerators because they are efficiency fanatics. This is why they bought Atari's in the first place.

At least Atari's have dynamic memory allocation. Mac programs have to allocate large spaced at the time the app is loaded. Ick.

I don't know how you think you're getting better quality, but there's no way
you could get better quality with Postscript. Calamus SL has very
sophistocated imaging routines and it produces an image at the printer's
resolution.

If you compared the best Postscript driver to the best PCL driver, you'd get
EXACTLY the same quality because they both work at the printer resolution.

There is a speed advantage when you don't use Postscript, because postscript
requires more information to do the same job of a bitmap at the printer's
resolution.

Your dithering algorythms you mention are a function of the driver and have
nothing to do with what format the data is in.

IBM and Apple are redefining what computing will be. The recently agreed upon PREP standard will let one hardware configuration run system 7, os/2 (in some flavor), and whatever Bill Gates brings to the table. Hardware is on the verge of becoming an irrelevant commodity. The PREP standard incorprates things like standard parallel ports from the PC world with things like ADB from the mac. Clone makers will just build to the standard and sell gazillions of boxes.

We buy hardware to run software. Apple is positioning itself to get out of the hardware business and into the operating system business. Will they succeed? Who knows in this silly business. But they are trying to change the paradigm; following a vision. Atari once had a vision "Power without the price". They acheived it ($800 for my ST vs. $2k+ for a Mac+), I bought in, then watched Atari fail to either keep up its old vision or develop a new one. Other than the Jaguar, what does Atari see as its own future?

What is the uniqueness of Atari (HW or SW) that justifies its continued existence? (Serious question folks, think about it)

In this months ST Review there is a review of all currently availably mtasking
systems; Mag!X, Geneva, MTos, SMS2, and Omen.

SMS2 got a nice review, so check it out.
They said TOS disk compatability may be a future update...

There are many examples to dispute this. The program that comes to mind right away is Calligrapher. It was a very powerful word processor, but the interface was awful. Items were in menus that shouldn't have been, there were pop-up menus for seemingly no reason, and almost everything was modal. TO top that off, it didn't work with FSM/GDOS or SpeedoGDOS. Warp 9 may be extremely well-coded, but the interface was awful -- and why couldn't they put the control panel for it in a CPX? You see, well-written depends on what you mean: Do you mean efficiently coded, or an all-around well-design product? If you mean efficiently coded, then we really can't tell unless we see the source code for a program. If you mean fast, responsive, and user-friendly, then I would say that Mac programs are better-written, with a few exceptions.

I stand by my statement that Mac programs are more sophisticated than Atari programs.

>
>Atari users like software accelerators because they are efficiency fanatics.
>This is why they bought Atari's in the first place.

The question is, how can someone claim that TOS is so efficient and well written when accelerators such as NVDI and Warp 9 are required so that you don't go mad using it. (Before you come to the defence that the VDI is a generalised set of graphics routines, keep in mind that QuickDraw on the Mac is the same.) There are other examples of software accelerators on the Atari ... and products such as Geneva exist because MultiTOS doesn't run well on 68000 machines.

>At least Atari's have dynamic memory allocation. Mac programs have to
>allocate large spaced at the time the app is loaded. Ick.

It's an annoyance, yes, but it's due to be phased out in another release of the System. At the Macs don't have the 8.3 filename limit...

You are picking out a few examples, when there are MANY wonderful Atari
programs to chose from. Take Diamond Back 3, for example... it has a
WONDERFUL user interface, and it's the only program that I've found that
wasn't a pain in the next to use to back up your hard drive. How about
Calamus SL with it's excellent programming, design, and well thought-out user
interface? How about True Paint? I and my fellow Atarians could go on and on
listing the Atari programs that cream the Mac equivalents.

And Mac programs are NOT fast and responsive.

No, the question is, why don't they have the same thing for the Mac? They sure as hell need it. The average mac user is some know-nothing who hardly knows how to use Microsoft Word, so he doesn't realize that his user interface could be improved by means of software. Even the knowlegable Mac users have been taken in by the media hype that says, "too slow? Buy faster hardware!" To that sort of reasoning, Atari users say, "BULL SHIT!" If it can't be improved in software, then there's something wrong, because we don't have the money for new hardware. Atari users have this attitude that the software should fit the hardware, not the other way around, so if they want something to be faster, they want to go out and pick up a piece of software to fix it. And guess what... they can! Some developers with the same attitude wrote software to speed things up. They don't do that on the Mac because their monkeys have been trained that the hardware should fit the software, so they go out and buy the most expensive Mac they can find.

Yes, but how easy is it going to be to get developers to upgrade for it? Do you know how CRITICAL dynamic memory allocation is for multi-tasking? I guess you don't... you own a Mac.

Speaking of Memory allocation. We Atari users have Warp 9 to make the graphics work faster. You Mac users have RAM Doubler to fix problems associated with not having dynamic memory allocation. Same sort of thing.

List away, but you may find that some mac programs have no Atari equivalent.

>And Mac programs are NOT fast and responsive.

Depends which mac and it depends which software. I think my PowerMac is
rather snappy, faster than my Atari anyway.

>No, the question is, why don't they have the same thing for the Mac? They
>sure as hell need it. The average mac user is some know-nothing who hardly
>knows how to use Microsoft Word, so he doesn't realize that his user interface

Maybe, but the average user is not the subject of our discussion. Everyone
here is at least profficient enought to use the internet.

>Even the knowlegable Mac users have
>been taken in by the media hype that says, "too slow? Buy faster hardware!"

And Atari says "too slow? Eat shit!"

>To that sort of reasoning, Atari users say, "BULL SHIT!" If it can't be
>improved in software, then there's something wrong, ...

There are many things that can only be resonable improved so much using
software. I'm sure that graphics rotations are faster on my mac hardware
then on your atari with it's "Superior" software. Also compression,
encryption, video capture, movie playing, simulation, etc.

>...because we don't have the
>money for new hardware.

Atari is a good computer if you can't afford anything better. No, that is
NOT the only good thing about Ataris.

>Atari users have this attitude that the software
>should fit the hardware, not the other way around,...

That would exclude Ataris form having any software that required a lot of
CPU power. ex: Ray tracing, rendering, digitizing video, playing movies...

>so if they want something
>to be faster, they want to go out and pick up a piece of software to fix it.
>And guess what... they can! Some developers with the same attitude wrote
>software to speed things up.

How much can they speed things up? Can they speed things up so the Atari
can complete a ray-trace faster than my PowerMac (Assuming that the
Mac software wasn't total crap.)

>They don't do that on the Mac because their
>monkeys have been trained that the hardware should fit the software, so they
>go out and buy the most expensive Mac they can find.

Hardware should fit the software. Why don't you port TOS to the C64 and show
me some of that famous Atari MIDI stuff. And you still have a ST and wouldn't
want a Falcon because the highly skilled Atari software designers can make
that 68000 feel like a 68060/66 right?

This is true. I've seen the new Diamond Back and it is definitely very nice.

> How about
>Calamus SL with it's excellent programming, design, and well thought-out user
>interface? How about True Paint? I and my fellow Atarians could go on and on
>listing the Atari programs that cream the Mac equivalents.

I've seen only the old Calamus (version 1.09N) with its horrible iconic
interface. I'm not knowledgable in the area of DTP, so I can't argue over
how well-suited Calamus may or may not be to DTP, but I hope the interface in
Calamus SL is different from the confusing icon-driven interface in 1.09N.
As for True Paint, I haven't seen it. I seriously doubt, though, that there
are many programs in this list which will "cream" their Mac equivalents.

>And Mac programs are NOT fast and responsive.

Sure they are. Of course if you run your programs under System 7 on an old
Mac Classic or something like an LC, they'll be slow, but to be fair, try
running modern Atari software on an STe with MultiTOS. Why would Mac
programmers, who until recently have been forced to program for slower
machines, create programs which are any less responsive than programs
for any other machine? I'm beginning to wonder how much experience you
have had with Macs.

>No, the question is, why don't they have the same thing for the Mac? They
>sure as hell need it. The average mac user is some know-nothing who hardly
>knows how to use Microsoft Word, so he doesn't realize that his user interface
>could be improved by means of software.

You supply no proof that the average mac user is a "know-nothing" who "hardly
knows how to use Microsoft Word." Anecdotal evidence does not count.
(In fact, this smacks of a kind of elitism. "We're Atari owners and we think
we know *all* the technical stuff, so we're superior.")

Even if your statemeny were true, and I assure you that it isn't, how do
you explain the hundreds of freeware and shareware enhancement utilities on
the various Mac ftp sites? It seems you're arguing two sides here. ON the
one hand you ridicule the Mac because you claim in needs software enhancements,
and on the other hand you hold of the Atari as a paragon of software
efficiency, because of all the software enhancements available. Which will

it be?

> Even the knowlegable Mac users have
>been taken in by the media hype that says, "too slow? Buy faster hardware!"
>To that sort of reasoning, Atari users say, "BULL SHIT!" If it can't be
>improved in software, then there's something wrong, because we don't have the
>money for new hardware.

Of course it's true that software can usually be optimized, but there is a
limit. That's why products like Warp 9 have stopped getting significantly
faster in the past few releases -- you can only optimise software so much.
At some point, new hardware will be required to achieve a speed increase.

> Atari users have this attitude that the software
>should fit the hardware, not the other way around, so if they want something
>to be faster, they want to go out and pick up a piece of software to fix it.

>software to speed things up. They don't do that on the Mac because their
>monkeys have been trained that the hardware should fit the software, so they
>go out and buy the most expensive Mac they can find.

The example you give below of products such as OptiMem and Ramdoubler
contradict what you are saying here, as do Apple's System Update releases
and various other third-party products which enhance the way the Mac System
works.

>Yes, but how easy is it going to be to get developers to upgrade for it? Do
>you know how CRITICAL dynamic memory allocation is for multi-tasking? I guess
>you don't... you own a Mac.

What kind of statement is that? Let's try to keep the level of the discussion
above that, ok?

In any case, there's no reason why dynamic memory allocation can't
be made totally transparent to applications -- RamDoubler does it, so I'm
sure Apple's system software programmers can achieve it.

A liguidator called Danmark(I am not sure of the name) has new performa 600's with keyboard, 5 megs of ram, 160 meg HD, cdrom, 16 bit color for $999. The source is from a relative who recieved a catalog.

I would sit down with both platforms and decide. Remember that Performa comes with clarisworks and other programs that are extra if available on the Falcon. Also that Performa is upgradeable to the PowerMac 7100, while the Falcon has no future.

So which Mac Model has the poor I/O structure and a hampered cpu? The Falcon is not a well designed machine. You have to deal with the mushy keyboard, expensive and cubersome memory upgrades and an OS that is a poor excuse compared to System 7. System 7 does more and has more funtionality than that other OS that is dead and non supported. Time is money, with the Mac you don't have to look for software. Every month you willbe bombarded with Mac mailorder catalogs that are a must have. Now, I dont miss the Sears catalog.

How do you know if it's nice. With the Performa, comes with Clarisworks for free!!!

Even the $862 Mac Quadra 605 8/160.. I don't think so..

> Cheap Sofware - Relatively high-quality and low-cost
> DSP - Can't get that in a low-cost mac, nice speed boost

Yes you can... How about the $1201 Quadra 660AV 8/230...

> Small OS - Takes less RAM
>

Does less with nil features..

> Mac
> ---
> Support - There are more macs...
> More Software - More software on the market including shareware
> Better software - Higher-end software is more available (probably not
> relevant due to the high-cost)

Yes there is high cost software, but all Performas come with software that has
no peers on the Falcon. There are low cost software that will rival anything
available on that other platform. Get a MacWarehouse catalog..

> Faster processor- Event if the mac FEELS slower it will BE faster in many tasks

There so many models. Be specific...

> Bigger HD - No comment

If it can only play cdrom based games it will take some time before it has
a good number of titles, what real use do you get in the mean time ?

for example : what graphics does it speed up (standards please) and why is
it on a isa bus ? (local-bus or better pci would make more sence). as
far as im told the jag would need extra hardware to do full mpeg-1 streams
do you know what chips they will use and what titles it can play ?).

Will the audio be used to simulate something like a gus or something like
that ?

Has anyone thought about printers and floppy disk drive formats. Okay I know that you can buy PowerPrint and that you can get a utility to convert between Mac and PC formats but it is extra hassel. One of the big plus points of the Falcon is its SCSI port which enables exotic things like CD-ROM and Optical Discs to be plugged in. The Falcon can also use a lot of PC type monitors. Buy Apply, stuck with Apple.

P.S. Send all flames to /dev/null.

>read about it has been in 'QL World' magazine.

>Assuming this is the case (and flame if I'm mixed up somewhere ;-)

>> What programming languages exist- LBASIC was mentioned, is there
>>a version of C in the pipeline?

I have ported Xlisp, xscheme and scm(another scheme), other folks
ported REXX awk, ...
Porting this stuff was realy easy with the c68 compiler
(easier than from unixV to BSD or vice versa)

>There is a fairly good C compiler for the QL, but nothing that gets
>anywhere close to GNU C or Lattice C

I must definitely flame this, c68 available for QDOS and SMS2
is very small (.i -> .s phase about 110K) full K&R and ANSI
and some extras (printf format string checking ....)
AND FULL sources and extensive libraries(curses,regexp ....).
AND FREE
AND ALL relevant GNU utils ported(except gdb, this is a real
drawback)

The library makes great effort to make porting unix programs
easy, only differences are in fork/exec and this is much more
comprehensive under QDOS/SMS2 than unix.

Xwindows is not ported, nobody attempted to make it work with
a QL (<2Mbytes in the vast majority).
Otherwise it should not be a problem.

The provided window system is very easy and extremely effective
to use - makes intelligent use of the keyboard, pointer/window
placing strategies etc..
There is already a quantity of programs from the QL which use
this window manager and there are programs to generate
GUIs (not an trivial task under SMS2 or QDOS).

>> How similar to Unix is the multitasking?

c68 libs make it appear very similar, otherwise very different,
extremely fast job-switch (about 0x68 bytes context information
under QDOS)

>Not particularly. MiNT is closer IMHO

>> Does it support the standard ST/PC disk format (for floppy and

at least flopies, easy to use

>> PD software was mentioned- how much is there, and where could I

>Well I assume they mean the *vast* quantity of QL PD ;-) There is not
>really a lot out there.

>> What is it like to use on a 1mb floppy drive system?

>Should be very good. Its a lot more compact than TOS.

I use QDOS with 1 720K floppy, it is excellent except for use with
the c68 compiler which already claims most of this 720K
(cpp,c68,as68,includes,libs,make ....)
But I can setup dynamic ramdisks and that makes it work.

>IMHO don't bother. I've had a bit of experience of standard QL QDOS
>(which as I said I *believe* SMS2 to be an enchanced port off, and in most
>ways it has no advantages over TOS/MiNT or MINIX. Its only advantage would
>be its compactness and efficiency.

some advantage is the THING system.
A THING is an named block of memory - or object, depending
how modern you like to view it.

THINGS may contain system extension, executable code,
shared data or something else and may provide their
own init,cleanup etc routines.
Extensions in things may also use a very sophisticated
parameter description/checking

This provides fairly sophisticated and fast job communication
without such overhead as with REXX or similar.

In my view the biggest difference between QDOS and SMS2
on the one hand and UNIX,MINIX,MINT on the other side is
the resident program concept of QDOS/SMS2, that means
shared code of program instances, but also requires
reentrancy of the programs.
Since the THING system it is easy to manage your
resident programs.

A drawback of QDOS/SMS2 is that they are best programmed
in assembler,basic or prolog, the c compiler has difficulties
with reentrancy.

Bye Richard

And it allows me to control the screen frequency of the half-toning, but
doesn't give me the option of using Floyd-Steinberg dithering (as I get
with GhostScript). The latter gives much better output on very low resolution
devices such as the 4-colour 300dpi DeskJet550C.

>If you compared the best Postscript driver to the best PCL driver, you'd get
>EXACTLY the same quality because they both work at the printer resolution.
Well, I *did* explain how and why I get better quality going via PostScript.

>There is a speed advantage when you don't use Postscript, because postscript
>requires more information to do the same job of a bitmap at the printer's
>resolution.
Going via PostScript is sometimes slower, but not for the reason you state.
You may also consider an advantage with PostScript compared with bitmaps is
that the rasterisation is done in the printer, so (although it's processor
may be slower than your computer) it frees the computer to do something else.

>Your dithering algorythms you mention are a function of the driver and have
>nothing to do with what format the data is in.
Yes, it is indeed true that the colour dithering is a function of the driver
rather than the printer language, but that doesn't alter the fact that
the best quality I can get from PageStream is via PostScript (and it would
be the same for Calamus if it came with PostScript output).

Hinting of fonts, important when typesetting at low resolutions such as
300dpi, should be done by *all* PostScript drivers (given the right fonts).

And PostScript allows me to print on someone else's better printer.

As I said, Calamus SL does not come with PostScript support. You have to
spend more dosh on an extra module.

As I understand it, that module is just an output driver. It will not
give full PostScript support (ie PostScript fonts, EPSF import,...).

In a previous article, mcssesw@dct.ac.uk () says:

>Discs to be plugged in. The Falcon can also use a lot of PC type monitors. Buy
>Apply, stuck with Apple.

In order to get a nice resolution like 1280x960 on a Falcon you can just get a
reasonably
good multiscanning monitor. With a MAC you would have to shell out BIG $$$
for a monitor to have that sort of display because of their fixation on
the physical resolution and screen-size. Also the Falcon will connect to the
following devices without any extra hardware:

TV (RF)
RGB monitors (ie SC1224) etc
Atari moochrome SM124 etc
Composite video on TV/VCR
any standard VGA/SVGA monitor in the PC world

Not anymore; now Apple has released its software for multisynch monitors which
allow physical resolution to be changed at any time, and it has two new
multisynch displays.

>TV (RF)

Macs can use Apple's displays, or they can use any standard VGA/SVGA monitor.
Most Macs can't be plugged into TV's (I believe the AV's can, but I might
be mistaken) but let's be honest -- who wants to word process on their TV?

I can only answer a couple of those questions.
For a comms program I just continue to use Uniterm because that is
all I need. However, I've also heard that Storm and Connect are good
(both shareware).
For word processing I use AtariWorks and love it. It came with my
4/85 Falcon here in the US. Marcel is a cheap $10 shareware editor
that is pretty good and works well under MultiTOS.
Hope this helps.

As anyone with experience with imagesetting knows, 50% grey almost always
turns out black, due to dot overlap. Can you develop a Floy-Steinberg
algorythm that takes this into account?

In any event, Floyd-Steinberg is pretty good for stuff on the screen, but I
have found it to be virtually useless on printers.

Calamus will let you set it to any linescreen, and you can even define the
SHAPE of the raster. Most of the time, people use a circle, but you can make
it a triangle if you wanted to.

No one doing serious professional typesetting uses anything less than 600dpi,
and true raster halftoning works just fine at 600 dpi.

>
>>If you compared the best Postscript driver to the best PCL driver, you'd get

>Well, I *did* explain how and why I get better quality going via PostScript.
>
>>There is a speed advantage when you don't use Postscript, because postscript
>>requires more information to do the same job of a bitmap at the printer's
>>resolution.
>Going via PostScript is sometimes slower, but not for the reason you state.
>You may also consider an advantage with PostScript compared with bitmaps is
>that the rasterisation is done in the printer, so (although it's processor
>may be slower than your computer) it frees the computer to do something else.

In order to take care of some of the detailed images that one might make with
a drawing program or desktop publisher, you have to have a very detailed
bitmap. For postscript, a language that DESCRIBES the image, it takes a hell
of a lot of information to describe very detailed images.

>
>>Your dithering algorythms you mention are a function of the driver and have

>>nothing to do with what format the data is in.
>Yes, it is indeed true that the colour dithering is a function of the driver
>rather than the printer language, but that doesn't alter the fact that
>the best quality I can get from PageStream is via PostScript (and it would
>be the same for Calamus if it came with PostScript output).

The reason you get your best output from PageScream is from PostScript is because PageStream is a horrible piece of software with very poorly designed printer drivers. PageStream RELYS on Postscript as its primary form of output, so it's no wonder you get better quality.

If you want to do a REAL comparison, get a program that is designed to do well with bitmapped output as well.

>
>Hinting of fonts, important when typesetting at low resolutions such as
>300dpi, should be done by *all* PostScript drivers (given the right fonts).

I do believe that Calamus fonts have hinting, but I'm not sure. However, no serious professional uses 300dpi for anything other than proofs or quick stuff he doesn't care much about.

>
>And PostScript allows me to print on someone else's better printer.

Aye. This is true. It has one advantage.

Dave, You can get a module called BRIDGE, that will convert a Calamus SL
file to PostScript.

Not a flame, but that is not true anymore. Apple has pretty much allowed
stamdard connections to their computers, and buying a Mac printer is just about
as easy as buying a printer for the Falcon.

But they are still Macs, and deserve to die horrible painful deaths. :)

While I will freely admit the C68 is a good C compiler, and IMHO has
done more for the revitalisation of the QL scene than anything else
recently - I *still* don't think its as good as GCC with decent MiNT libs.

This is based on trying to port several programs using it, which had
previously been ported with GCC to an ST.

Its alot better than some of the original QL compilers though.

Roland.

In article <2r99nf$hs9@mother.usf.edu>, millert@undergrad.ec.usf.edu.
(Timothy Miller) writes:

If the program could use some OS functions without the multitasking
overhead, some tasks could have improved overall performance even
while
multitasking. Also, just about anything you can do with the Mac
through the
OS could be done faster, and it isn't, which 'gets in the way'.
==========

On any machine one can do things faster by 'going to the hardware'
but 'metal' programming is not neccessarily good practice because it
degrades compatibility. If one goes strictly by APDA guidelines, one
doesn't have to worry about the program not being compatible with new
hardware/software environments. Viz the fact that most well-written
System 6 apps will run fine under System 7, while there are a great
number of things that will not work at all under the Falcon's new
MultiTOS. I am sure that GEM/TOS programs written in a strictly
'vanilla' style would work fine with MultiTOS, but what with the way
most Atari programs seem to be written... well, I haven't had much
success with MultiTOS. (Geneva, is however, another story. VERY nice.
I like Gribnif products because I can TRUST Dan Wilga not to do
anything weird)
I have to handle at my job about 6-8 Ataris networked. The
frustrating thing is that at least 30% of our AUTO folder programs
are incompatible and about 10% are, in fact, mutually exclusive. On
my Mac at home, I have about 40 or so extensions and control panels
(both of which kinds load resident, patching code) and only one or
two cause any sort of problems. I think that this directly relates
back to the fact that Mac users are less tolerant of having to do
massive twiddling of their setup; but most of all to the good specs
and massive totalitarian control Apple exerts to coerce developers to
use ToolBox calls. There's a good reason for all this; stuff does not
break nearly as much on the Mac as on the Atari *for complicated
setups* For Atari, that's the only experience I've got; it may be a
snap for a home user with a Mega (I deal with TTs and Falcons.)

really have to disagre about the Mac being more cpompatable than an
Atari machine. When system 7 came out, there were hundreds of articles
written about compatability, checking programs with databases full of
such information, etc. I have had little problems getting my software
to work with MTOS, nor have I had nearly the problems getting Auto programs
to run together, unlike on the Mac, where we were crashing about once per
day, and having to undergo massive testing just to get a bare minimum of
E
system extensions and control panels working together.

>

Yeah, I'd like them to buy too. This way I can sell my stock and make money off of it. I can then repurchase the stock when the price settles down. :)

What would YOU know that I wouldn't? Are you dating one of the Tramiels or something??

I predict that we will see a Mortal Kombat II release for the Jaguar at the Summer CES. I also predict that we will see Atari's sales estimates raised to 1 million to 1.5 million. I don't see any other earthshattering news. Unless Time Warner is planning to buy out Atari Corp. But I doubt this will happen since the Tramiels have waited for success forever. They wouldn't get out before it actually happened.

Just out of curiousity, what is your age? (around)

Thanks.

But I have exactly the same problems with Calamus output as I had
with PageStream.

>I do believe that Calamus fonts have hinting, but I'm not sure. However, no
>serious professional uses 300dpi for anything other than proofs or quick stuff
>he doesn't care much about.
I'm not a `serious professional;', my trade is software. But, that doesn't
stop me wanting the best possible output on the equipment I've got. Calamus
and PageStream don't give me that directly.

==========

I have not found this to be the case. There are problems with memory control, speed, and nearly half of the AUTO folder programs I have to use. The whole lack of control problem is why Geneva is so great: you can make things work if they do not do so already.

Besides, now there is NOTHING that will not run under System 7; it has been out for 3 1/2 years now; and I (my personal experience) found only a few things (most of them 3-4 years old when I got System 7) that would not work with it. The vast majority of my apps, and especially my extensions, worked fine when I upgraded.

Besides, get my reasons: since Mac programs are more insulated from the exact hardware through Toolbox calls, and since most Mac developers use these calls, AND since Apple has a series of excellent, available, and easy-to-use references to its API, more mac programs are written according to the rules and they do not break under new software if they are written according to the rules. Apple's Own MacWrite 4.5 still runs fine on my Mac today- nearly 8 years after it was written, on an OS that is about 5 versions beyond what it was written for, on a color computer that has 18 times the memory of what they had in mind. Same for Writenow 1.0, etc, etc.
+ Please note that Microsoft Mac software is NOT well-written+

>HAM modes. One uses a different 16 color palette for each scanline on a
>512 lines high screen.

Big deal. The Atari ST could do this, too, and, in fact, many products
did. Amiga users used to make fun of this kind of thing as ugly,
pathetic and embarassing. Not that it's surprising to see them
trumpeting them now.

The problem with these kinds of hacks is that they suck a lot of
CPU time when you're doing an interactive task. (No, I'm not saying
that using the copper to load new values for the palette is going to
suck CPU time.) Whenever you want to, say, paste one bitmap
onto another one (this one, or both, produced with a palette swapping
method, or a page-flip method, or a HAM method) you have to remap
one to the other. This makes things like paint programs a lot more
CPU intensive than they need to be.

When it comes down to it, 24bit color is _cheap_, and it is also
easy, and can also be fast. Using hacks like these should be an
interim solution, not a solution that lasts 10 years because
Commodore couldn't be troubled to implement real 24bit color. They're
almost as bad as having to have a palette manager that maintains
seperate palettes for different windows on the desktop, a la Windows
3.1 or OS/2 on <16bpp displays.

>Now this is impossible to do on the PC just for the fact you have no way of
>knowing on which scanline the videobeam is. let alone you cannot change the
>palette on the fly.

On the other hand, if you want 24bit color on the PC, you just
buy the card. 24bit can be had for ~$100, fast 24bit for $200
and fast, high resolution, non-interlaced high refresh for little
more than twice that.

> : Yes, and they're all slow. Simple. Even in Windows I can repaint a 24-bit

>480.000 colors on screen..

24bit color is more than number of colors on the screen. If that
was the real issue, you could get by with a lot less than 16M as
long as you had a 24bit palette to select from. But colors on the
screen really isn't the whole story.

[...]

>Most $100 cards you like to use to claim 24bit cards are cheap can only do this

No, in fact, I don't know of any low-cost 24bit card that supports
24bit color in <640x480. Can you name one for me, please?

Since when has the ST had more than 512 colours? Ok, the STE had 4096,
but I don't recall it ever being supported. And I also don't remember
making fun of it as an ugly hack - I grew up on the 8Bit Atari (which is,
in fact, the pre-cursor to the Amiga) and used these tricks all the time
(back in those days we called them DisplayList Interrupts) and when I
moved up to the Amiga I was happy to see I could still do it. Why would
it be an ugly hack to display more colours on the screen than the depth
allows, thus saving RAM?

True. Almost. There are some _very_ fast algorithms for remapping
palettes. Even DPaint, which is optimised for accuracy, not speed, isn't
too slow, and if you're not too worried about accuracy then it's even
quicker.

Commodore _were_ implementing true 24Bit GFX before their untimely
demise. And 3rd party 24Bit cards have been around on the Amiga for a
while now.

I can buy them for my Amiga, too. And they offer similar advantages to
the standard Amiga modes (draggable screens, etc.)

I think the TsengLabs card does. And surely that should be a standard
feature anyway.

Why would he need SCSI-II and IDE, if the Performa has built in SCSI? As for Desktop publishing, if you are a student and or staff, you are eligible for discounts on PageMaker. My Campus bookstore has pagemaker 4.0 for $53 and 5.0 for $199. If your income depends on pagemaker than you can afford the cost of pagemaker and Quark. There are alternatives such as Aldus HomePublisher for $45.

Why would he need a dsp? If he needs a dsp, he can get the Quadra 660AV 8/230 for less than $1500, which is still cost affective than the Falcon.

I can play this game to: With the Falcon, you would need to upgrade the slow 030 with an 040. But there is no 040 upgrade. Plus 4 megs of ram will not cut it. Add $500 for eight megs(I am being generous) plus $300 for a decent size harddrive. No your upto $2000 and that does not include the not available 040 board.

There are other models to choose from. Apple has the mac Quadra 605 8/250 with software bundle - ClarisWorks, Quicken and many others for under $1200. Much better buy than the FALCON!!!!

Wrongo AGAIN! You Amiga people are SO WELL INFORMED! There isn't a SINGLE
PC card out there that does 320x200x24-bit. Period. Tseng Labs produces
chipsets and none of them ever did 320x200x24-bit.

I don't ever recall dynamic paletting being looked upon with scorn by Amiga users, since it's a standard part of the OS. Perhaps you are getting confused by the fact that the way the St went about it was incredibly ugly compared to the Amigas copper.

True, but it eventually gets better results using less resources to display them.

: did. Amiga users used to make fun of this kind of thing as ugly,
: pathetic and embarassing. Not that it's surprising to see them
: trumpeting them now.

A Ham6 overscan interlaced images looks very good (Using 0%
of the CPU), compared to a ST hacked display using , what, 100%
of the CPU to get its 512 colors onscreen?
I dont see how even a 16color per scan line amiga display can
compare to a ham6 'render'.

: The problem with these kinds of hacks is that they suck a lot of
: CPU time when you're doing an interactive task. (No, I'm not saying
: that using the copper to load new values for the palette is going to
: suck CPU time.) Whenever you want to, say, paste one bitmap

: method, or a page-flip method, or a HAM method) you have to remap
: one to the other. This makes things like paint programs a lot more
: CPU intensive than they need to be.

Ham6 painting can be fast if you work with a true color image buffer.
I dont think there is anyway to get scanline palette painting
effective/usable... its ok for images designed with vertical color
change: like a sunset view from the coast of newzealnd :)

For games with say dualplayfield, copper reloading of the color
palette is great.Or just for gradient effects, info pannels etc.
the ST can do this with the CPU, The amiga setup a copper.. PC?
they use a 256color palette so they dont care :)

To bad OCS never got a + mark, the + including chunky 256colors
display...

: When it comes down to it, 24bit color is _cheap_, and it is also
: easy, and can also be fast. Using hacks like these should be an
: interim solution, not a solution that lasts 10 years because
: Commodore couldn't be troubled to implement real 24bit color. They're
: almost as bad as having to have a palette manager that maintains
: seperate palettes for different windows on the desktop, a la Windows
: 3.1 or OS/2 on <16bpp displays.

Ham8 with a 040 is has fast has a cheap 24bit card... But then it
has 18bit banding and Ham artifacts.
EGS is not a bad solution for true color aplications.(Its good nobody
waited for CBM on this one)

: >Now this is impossible to do on the PC just for the fact you have no way of

! I love the poor bastard.... when I'm bored-- I just scan the news
! spool for his id for a guaranteed laugh!

I installed a mailer daemon that allows checks for "nasty" people. Now any mail from the clap goes to an account called "wank*r". So when I want to laugh at him I log in to the wank*r account, and read any mail the "wank*r" has sent me. I think the last "message" read something like:

You are an asshole and a disgrace to the UK.

and that was it. Weird. I'm not even sure why this was mailed to me. The nice thing is that I can set a cc line, so that anything he mails to me gets cc'd to his postmaster, for example :-)))

At the moment it's set to just mail him back telling him that his mail was rejected :-)) It's all stored on a scratch disk, so even if he uuencodes his kernel and mails me, he won't hurt anything :-))

Oh by the way - my vote is NEA - he's always worth laughing at :-)))

Simon

Try giving HAM6 a different base palette on every scanline by combining these tow techinques. Looks a lot better than normal HAM6.

There are cards that do this, but it doesn't seem to be supported on
all chipsets. I've built a few machines with Cirrus Logic SVGA boards
that include a testing program which displays 320x200 in 16bits and
24bits. It may be a hacked mode of some kind, but it invalidates your

Short memory. Bashing the ST for having anemic color support
was all the rage for Amiga users back when Spectrum 512 and
Quantum Paint shipped for the Atari 1040 ST (yeah, many years
ago).

The fact that you don't recall it means nothing to me. At best,
it says you weren't around when the A1000 was standard and the A500
was new.

>since it's a standard part of the OS. Perhaps you are getting confused by

>Amigas copper.

What's your point? Same ugly hack. Goodness, can't you admit that
there is *anything* wrong with the Amiga? Heck, why not use *one*
bitplane instead of many? Oh, sure, the Copper can't manage in
that case, but the CPU could.

>
>True, but it eventually gets better results using less resources to display
>them.

Nope. This isn't even in the realm of reality.

At *BEST* these methods can MATCH the output of a much simpler,
straightforward method, and often (as is the case with HAM), they
do much worse. In all cases, you incur a penalty. Frankly, saving
a few kilobytes is totally worthless to me--RAM is cheap enough
that the difference between true 16bpp and 24bpp and HAM8 is
minor--the former will compress better than the latter, as well,
in relative terms.

Face it. If Commodore hadn't pissed away their R&D funds, and
had actually gotten a decent colordepth and refresh rate out of the
Amiga, you'd be agreeing with me.

Actually, I was, although I didn't have one myself. I have used Amigas from very early on. The Amiga rrelies on this techinque to get it's dragable screens, which it has always had. I therefore find it difficult to believe that Amiga fanatics would criticise the ST for trying to emulate it.

|> >since it's a standard part of the OS. Perhaps you are getting confused by

|>
|> Nope. This isn't even in the realm of reality.
|>
|> At *BEST* these methods can MATCH the output of a much simpler,
|> straightforward method, and often (as is the case with HAM), they

Not necessarilly, especially if you lack the bandwidth to do the obvious techniuqe. Take HAm, for example. I have done HAM6 in 1024*768 on my A1200, giving me 4096 colours. Now I imagine that some PC's around there can do that, but I've never seen one that can, and I think they'd be a hell of a lot more expensive than my A1200.

|> do much worse. In all cases, you incur a penalty. Frankly, saving
|> a few kilobytes is totally worthless to me--RAM is cheap enough

Efficiency matters to some people.

|>
|> Face it. If Commodore hadn't pissed away their R&D funds, and
|> had actually gotten a decent colordepth and refresh rate out of the
|> Amiga, you'd be agreeing with me.

No I wouldn't. Take AAA for example. The proposed AAA specs (which hopefully we may one day see as reality) for the mid range system would give 1280*1024 non interlaced, 1280*2048 interlaced @8bpp (72Hz, I think) using 64 bit DRAM. Now, what would look better in this mode? A huge JPEG displayed in 256 colours or a huge JPEG displayed in 262144 colours? These techinques are scalable, and when you near the edge of your bandwidth capibilities, the slightly clever, more efficient approach wins out.

And the ATI Ultra Pro can display 1280x1024x256 non-interlaced too. That was
almost two years ago. The Ultra+ and Pro both use 64-bit DRAM. Seems
like our hardware of two years ago has about the bandwidth of that which
will never even materialize for you.

No, they don't. Both the Pro and the + use 32bit wide RAM. The
difference between the two is that the Pro uses VRAM and the Plus
uses DRAM. Not noticible, especially, unless you're running in 16bpp
mode @ 1024x768, in which case you take a speed hit.

2560. Atari 520 ste for sale

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-23 12:13:42 UTC
From: osantiag@fiji.gesd
Message-ID: <2rq6lm$sos@cnn.MOTOWN.GE.COM>
Source record: 16857

I am currently selling my 520 ste with 4 mb/ 120 mb HD. This system includes a color 1224 monitor with Spectre GCR emulator with genuine MAC roms. I am selling the system for $600 or
best offer. The system has the ICD link adapter for the hard drive. I am also will to trade the machine for a 486 DX33 or DX/2 66 I don't need a monitor for the IBM machine. You can notify me at 215-457-6074 or a the mail address below. Thanks.

Sincerely,

Orlando Santiago osantiag@motown.ge.com

P.S. I am still an Atari user. I still have my spare Mega 4 machine. I need a PC for a job that I am working at.

All you're telling me is that you don't remember the bashing. As
I said in the first message, this doesn't surprise me at all.

>I have used Amigas from very
>early on. The Amiga rrelies on this techinque to get it's dragable screens,

Yes, it does. But for seperate screens you don't have to screw
around with remapping colors before you blit. When you use it to
get around the Amiga's pathetically low bandwidth limits, then
you _do_ need to remap.

>which it has always had. I therefore find it difficult to believe that Amiga
>fanatics would criticise the ST for trying to emulate it.

Tough shit. The Amiga users at the time were too full of themselves and
HAM to be bothered with ugly, hideous hacks like register swapping or
page flipping. The fact that HAM was a total pain in the ass to use in
animation (not simple page flipping) and paint programs (it was _years_
before decent HAM paint programs came along--digipaint 2.0, 3.0, Photon paint
--they all stunk) was also happily overlooked.

>> What's your point? Same ugly hack. Goodness, can't you admit that
>> there is *anything* wrong with the Amiga? Heck, why not use *one*
>
>There's plenty of things wrong with the Amiga, but this is not one of
>them. It is a useful feature, not a hack.

It's a hack. Jesus, what do you think a hack _is_?

>|> bitplane instead of many? Oh, sure, the Copper can't manage in
>|> that case, but the CPU could.
>
>now you're being silly.

No, I'm imitating you. Let's face it. RAM is cheap, CPU cycles aren't.
Having to remap between every single damn blit that changes position

vertically is ridiculous. The only time these hacks are efficient are
when they are being used to display a static image (or a series of them
by page flipping).

>What is wrong with making optimal use of ones video
>bandwidth? you seem to be arguing against efficiency.

No, I'm arguing against wasting CPU time to save a few kilobytes of memory.
If the Amiga wasn't stuck with such outdated video hardware, nobody would
be using these hacks.

>> >True, but it eventually gets better results using less resources to display
>> >them.
>>
>> Nope. This isn't even in the realm of reality.

>giving me 4096 colours. Now I imagine that some PC's around there can do that,
>but I've never seen one that can, and I think they'd be a hell of a lot more
>expensive than my A1200.

You need to get out more. The fact that an A1200 is dirt cheap is kind
of irrelavent. For $300 you can get an accellerated, FAST card like the
Diamond Viper and get 16bpp @ 1024x768 @72Hz NI, and have plenty of
bandwidth to spare. No hacks, cheap. If you're constrained to spending
<$1000 on the computer system, then Amigas make sense. But they don't
compete with PCs.

And "some PCs"? Sheesh. The Viper is old and out of date these days, as
are the ATI GUP and GU+, the two widest-selling accellerated cards. Now
we're into the 4MB 24bpp (all modes but 1600x1200, which is only 16bpp)
generation. No hacks, no ugliness.

Look, this kind of hack is good if you need to get around a weakness
in your hardware. That's all they're good for. If the Amiga had up-to-date
video hardware, only technogeeks would even _care_ if their machines could
use bizarre hacks to get extra colors.

>> do much worse. In all cases, you incur a penalty. Frankly, saving
>> a few kilobytes is totally worthless to me--RAM is cheap enough
>
>Efficiency matters to some people.

You're deluding yourself if you think that these hacks, by saving a few
bytes, outweigh the CPU penalty they incur when displaying anything but
a static image. Get real.

>> Face it. If Commodore hadn't pissed away their R&D funds, and
>> had actually gotten a decent colordepth and refresh rate out of the

>> Amiga, you'd be agreeing with me.
>
>No I wouldn't. Take AAA for example. The proposed AAA specs (which hopefully we
>may one day see as reality) for the mid range system would give 1280*1024 non
>interlaced, 1280*2048 interlaced @8bpp (72Hz, I think) using 64 bit DRAM. Now,
>what would look better in this mode? A huge JPEG displayed in 256 colours or a
>huge JPEG displayed in 262144 colours?

How about in 24bpp as with the ATI GPT? 24bpp @ just about any
NI mode up to and including 1280x1024.

>These techinques are scalable, and when you near the edge of your bandwidth
>capibilities, the slightly clever, more >efficient approach wins out.

The problem here is that you seem to think that the rest of the world is
saddled with the same crippling bandwidth limitations that keep rearing
up for the Amiga. The rest of the world _isn't_. There's no need to hack
to get 1280x1024 w/pseudo-24bit because you can get _f*a*s*t_ 1280x1024
real 24bit. As for interlacing it, why bother? You can barely fit x1024
on most CRTs, and you definitely can't fit x2048 without massive (~70%)
scanline overlap. If you're willing to spend a fortune on a x2048 capable
monitor, you're not going to be worrined about the extra $150 or so in
VRAM that you'd need to spend to get real 24bpp instead of HAM.

```
+-- This was written in a previous article by DuncMan...
|> Duncan (75% certain to save up and buy SMS2)

Well, here I am again. Having read the ST Review feature (The
mag really has improved since I last read it), some useful EMails from
readers, and the posts stuck here, I've been reconsidering my opinion. I've
tried to draw up a list of each system's advantages and disadvantages.
If I've got anything wrong, then please correct me.
AFAIK, there are currently 5 multitasking replacement O/Ss that
will run on an STE. My system is rather minimal, being just 1Mb with no
HD. This has coloured my opinions a little, understandably.
Oh, and it was ST Format that thought SMS2 was the same as Unix...

GEM type O/Ss
-------------

MultiTOS
--------
for: The official standard
Pre-emptive
Built in desktop
Compatible with MultiTOS (!)
against: Bugged (alledgedly)
Needs 2Mb & an HD
Tricky to configure
Slow
Uses GEM-style interface

Geneva
------
for: Fast
Stable
Extra facilities over GEM
against: Needs 2Mb
Runs .TOS & .TTP programs in single tasking mode
Co-operative
Does not replace entire O/S
Needs separate desktop
Limited features
Not fully MultiTOS compatible
Uses GEM-style interface

Mag!x
-----
for: Very fast
```

Stable
Built in desktop
Runs .TOS & .TTP programs in multitasking mode
Compatible with TOS/GEM
against: Needs 2Mb
Uses GEM-style interface

Non-GEM type O/Ss

OMEn
----
for: Versions coming for other systems
Built in desktop
Device drivers
against: Not compatible with TOS/GEM
No apparent support yet
Not available yet

SMS2
----
for: Pre-emptive
Very fast
Very small
Built in desktop
Built in networking
Device drivers
Works in 0.5Mb & no HD
against: Not compatible with TOS/GEM
Object oriented (jargon!)
Little apparent support yet
Needs separate MSDOS/TOS disk reading software
Relatively expensive

I have to admit, I don't much like GEM. It looks somehow
primitive (this is understandable when you consider how old it is) (as
does MS Windows, IMHO). I'd rather be using a computer with a more
professional, capable feel. SMS2 gives me that impression.
There isn't a whole lot of software yet, but what there is looks
rather more capable than a lot of the GEM stuff that exists. I also like
the use of a 6*8 font in SMS2 and OMEn- allowing an 80*25 terminal emulator
to sit in window, or lots more columns of a spreadsheet to be seen at
once.
I'm not sure I want to stick with an O/S that is based on TOS,
let alone GEM. I'd like to be able to share data with my exsiting
GEM/TOS software, but that means being able to read the disks. A few
people have said that there is an SMS2 program to do this, but I haven't
heard anything about this on OMEn.
In summary, then;

Duncan (85% certain to save up and buy SMS2
60% " " " " " " Mag!x

```
60% " " " " " " OMEn
40% " " " " " " MultiTOS
35% " " " " " " Geneva)

> 660AV 8/230
> for less than $1500, which is still cost affective than the Falcon.

Well, you must live in a place near heaven or something.
That machine you say costs less than $1500, here costs more than $3100.

If I compare that to $915 that a 4MB Falcon (without HD) costs, I
think is more cost effective than the Mac.
Now if I add to this a 1GB (Micropolis AV2210) hard disk: $1600 and
$250 for a SVGA screen , I am STILL lower than the Mac.

And I need the DSP. After all not everyone has 16 audio tracks in
Cubase...

I was there, on _both_ sides of the fence (I bought a 130ST - remember
them?) and I never once recieved a criticism from an Amiga user about my
ST's DLI - they just took the piss out of its crappy sound, low
resolution, appaling GUI, and laughable OS...

Back then HAM was considered nothing more than a curiosity... Kinda
nice, but with no practical use.

You can do some things with the hacks that you CAN'T do using traditional methods - check out the TET demo (pretty old now) and look at the copper bars section, then go and do it on your PC... You mean you CAN'T? That's sad...

>>> do much worse. In all cases, you incur a penalty. Frankly, saving

Millions of people can take advantage of these deals. But, there are less expensive alternatives. Like I said, if your income is depended on DTP, than you can afford PageMaker and Quark. For most people, Aldus Home Publisher will be adequate.

My tuition and living expences amount to about $6000, mostly paid by the Tax payers. Thanks guys and gals...

I suggest you visit a software store and check out prices. Do not quote Microsoft stuff.

Source record: 16883

-> If it can only play cdrom based games it will take some time before
-> it has a good number of titles, what real use do you get in the mean
-> time ?

For a start, the Jag CD-ROM will be out before the Sigma Designs board. The Sigma board isn't slated for release until the fall at the earliest. In addition, the Jag CD-ROM is being delayed so that more titles can be completd before the CD-ROM's release. Currently there are 11 CD-ROM titles in development, some near completion. By the time the Sigma board is released, most or all of these titles should be available.

-> for example : what graphics does it speed up (standards please) and
-> why is it on a isa bus ? (local-bus or better pci would make more
-> sence). as far as im told the jag would need extra hardware to do
-> full mpeg-1 streams do you know what chips they will use and what
-> titles it can play ?).

A) It's the equivalent of a Windows accellerator. B) It plugs into an ISA bus in order to communicate with the widest possible range of PCs. Had they made it a VESA ir PCI design they would have restricted its operation to only machines with equivalency slots. C) The Jaguar does need extra hardware to do full MPEG streaming; hence the reason that MPEG 1 and 2 are coming out on a Jaguar cartrige (both levels on 1 cart) to provide that function. THe Sigma board is different only in that it contains the full streaming hardware.

-> Will the audio be used to simulate something like a gus or something
-> like that ?

The audio is strictly proprietary and will likely not emulate anything. (It's concievably that in _could_ be made to emulate a GUS or SBPRO ASP/DSP, but Sigma havn't alluded to any such emulation as yet)

This is a bug of AHDI 6.03, get AHDI 6.061. The only way I found of
recovering the data is to recreate the first sector and sometimes the FAT
as well. If you use DMirror or ST Mirror then you will have a copy of your
FAT.

Thats the whole point, I don't like GEM much, and GEM programs
not much more. I already have single tasking TOS 1.62 in my STE, I can
run GEM stuff with that.
However, if I get a new O/S, I want a new, better interface.
IMHO, GEM just doesn't cut it any more.
Perhaps if they changed the appearance of GEM I might like it
more... Hrm...

As you said, you own a standard 1MB STe. You just won't get the best out of GEM with any of the three standard graphics modes. GEM on a Falcon and SVGA is pretty amazing though - it gives a much better working environment. I use 16 colour mode at a 736*528 resolution (you can get much better with a better monitor) and even my old GEM programs look *much* cooler.

And programs which are written for later versions of the AES (ie the Falcon/MTOS one's) are even nicer. If they use the background, activator and indicator bits in the RSC objects you get a great interface that's very NeXT like (in appearance).

You are stuck with GEM though - there's no way anything else will work on the Atari. Although SMS and Omen are very clever they will be limited to a few anoraks.

As I understood it:

Sinclair originally asked GST to do an operating system for them. The result seems to have been called 68K/OS and wasn't good enough. QDOS was written by Tony Tebby, in rather less time than most people would like to have when writing operating systems. IMHO he did a surprisingly good job, especially by the time the bugs had been cut down a bit...

Tebby has since written SMS2, and also SMSQ (which is much more of a QDOS clone --- it runs on a card which plugs into the ISA bus of a PC.

I believe 68K/OS was actually released separately, but has long since sunk without trace.

As for 68K/OS being SMS --- don't know. I doubt it, but that's just my opinion.

As for compatibility between SMS2 and QDOS... Some QDOS programs will run under SMS2. Of the QDOS programs which *won't* run under SMS2, not all of them will run under all version of QDOS either...

Generally speaking, programs written in C will work on either; programs written for the QDOS pointer environment will work on either; other programs will have to be checked on an individual basis.

(I used QDOS here in Cambridge, QDOS and SMSQ at home, but I've only run into SMS2 on a couple of occasions. Maybe if I come across a cheap 2nd-hand ST...)

Yes, the QDOS file system is not one of the worlds best; the reason for
this is that subdirectories were rather hacked on as an afterthought.

>I assume SMS2 has at least level 2 device drivers, but it"s

I'm told that SMS2 originally included the appropriate code but it was
removed after it turned out to be slowing things down for some reason. I
don't know if this has been solved yet.

For starters everything is just harder. Like in the desktop video
market (if the software is so expensive, which on the Mac it is).

Eh? Microsoft is one with the lowest prices. I have gone into
several stores, thank you very little.

Wow. And as we all know your experience is thwe absolute measure of WHAT IS.
Get a grip, okay? My point is that System7 was not this universally happy
upgrade that everyone seems to remember it as being. Maybe you didn't have
a mac back in 1991 when 7.0 first came out... I worked for a software
developer and we got (at the height) about 50 to 100 requests per day for the
free upgrade because our software did not work. OTOH, I've not needed to
upgrade a thing to get it to work with MTOS. Which simply means that anything
that didn't work is not important enough to warrant a fix. All the right
things work. And yes, that is only my experience, but it is just as valid
as yours.

You must be referring to the Atari 130XE computer. It was an 8-bit computer
and it never competed with the Amiga.

Okay, the street price of a Quadra 605 8/160 is $900, still $300 less than a Falcon. As for music being a plus on the Falcon, is not true anymore. Musicians are using Macs as their platform of choice over the Falcon. As for games, I suggest you subscribe to Mac Games and get a hold of Mac cdrom warehouse. There are more cdrom games on the Mac than there are on the recently deceased CD32.

Hello all.

I need (Ha! *want*) a good DTP to do the company news letter, occaisional promotional material and proofs for the adverts we run. The two main contenders seem to be Calamus and DA's Layout.

The main concern of the boss is that the program should understand text and produce good quality and consistant output (We use TeX and LaTex for internal documants---on the grounds that it is a very clever program)

My interest is to produce stuff that he will accept, be able to get films from and which I can use for the fun of it too.

I have a Falcon 030, 141 MBHD, and we have not yet decided on a printer.

Any ideas anyone?

xavier

re. Recovering partitions. I use KnifeST it's great. One problem though you have to have the partition recognized by the system to use it. So if you get it recognized at boot then you should be able to fix it.

Check your history books. The 130ST was real. I had a 130XE too, so I
know the difference! (I think I have an old issue of A.N.A.L.O.G. with
advertisements for the 130ST if you _really_ want to see.) IMHO, the
Atari 8Bit range blew the hell out of the STs. I still use my XE today,
but my ST (I upgraded to a 1040STE before I saw the error of my ways) has
long since bitten the dust...

I don't know anything about DA's Layout, although I'd be interested in hearing
about it.

I can, however, highly recommend Calamus SL. We produce everything from
simple flyers to full color brochures to an Atari magazine with the greatest
of ease using Calamus SL. Its output is of the highest quality, the imaging
is very sophistocated and powerful, and if you want consistency, you got it
because Calamus can measure in units of 10^-7 meters and can zoom in to
999999% so you can line things up perfectly. There are printer drivers for
just about everything and the results are superb.

The HP Laserjet 4 seems to me to be a very nice printer.

2608. **The Falcon is a ripoff!!**

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-26 06:56:00 UTC

Message-ID: <60.5103.5323.0N19FDC8@canrem.com>
Source record: 16814

Let me ask you something...

Why do you even *POST* here? You obviously have no love for Atari, you obviously have put all your energies to promoting the Mac ... so WHY POST HERE? This is NOT c.s.mac.advocasy. This is NOT a forum to discuss the merits of Macs or to play up the faults of the Falcon or any other Atari product. We don't *CARE* about Mac prices. We don't *CARE* that Mac has this and it's cheaper and the Falcon's a piece of dog dropping. WE have bought the machines we have because we *like* them and because they do what WE want at a price point that WE find (arguably) acceptable compared to our other choices. So why even BOTHER to waste bandwidth with your highly futile, extremely inflammatory comments about Atari products? Are you trying to convert us to worship on the altar of the apple insignia? If any ONE of us were, even in the smallest way, thinking about moving over to the Mac computer, we would be looking in the Mac advocasy newsgroup, NOT HERE. those of us who frequent this newsgroup are looking for Atari information, NOT MACINTOSH INFORMATION.
Your comments are unwelcome, they are highly biased, and most of the time, just plain dead wrong. You are posting opinions and contriving to force them upon the rest of us as though they were the gospel. Trust me. You have made no friends here, not will you by making such derogatory and needless comments designed only to invite flame and waste further bandwidth on *pointless*, *futile* discussion. Please, do us all a favour, and stop polluting this newsgroup with your useless messages. They aren't doing anything positive. THey're just simply a waste of space.

I think when you do a (F)ollowup message to someone (like I'm doing
here) there should be a choice in the header called "Followup-To:" -
just stick the name of the group(s) you want the followup to go
to there, and it should route everything that way for you.

I generally use "alt.flames" as the followup group for my
responses to the net weasels that seem to be appearing of late :-)

|> Okay, the street price of a Quadra 605 8/160 is $900, still $300 less than a
|> Falcon. As for music being a plus on the Falcon, is not true anymore.

With Keyboard? Add $100 more. $200 less.

|> Musicians are using Macs as their platform of choice over the Falcon. As for
|> games, I suggest you subscribe to Mac Games and get a hold of Mac cdrom
|> warehouse. There are more cdrom games on the Mac than there are on the

I have. Games are really bad on the Mac in general. They are a subset
from what the PC/Amiga has. The only games that are 'catching on' the Mac
are CD-ROM roleplaying style, which are good, but there are few of them
and then, again, a SUBSET of the PC. The Mac has almost no good
action games. Crystal Quest? Joke.

Beyond Dark Castle is the only one I have seen so far that deserves
a '5 star' rating.

|> recently deceased CD32.

|> >
|>
|> I thought I had, but here it is...

Thanks for the try.

|>
|> Ray Dream Designer 3.0 $249.

Doesn't do animation *at all* if I remember correctly.

|> Add depth 3D $99.

Doesn't do animation at all.

|>
|> Painter X2 $99
|> DesignCad $155

Again, no animation.

|>
|> Video Director $129

I wonder if this is the same as GoldDisk's.

|> Infini-D 2.6 $519

A nice joke. This is the one I got my hands on
and although the product is good considering what it
does, it shouldn't be so overpriced. Real 3D costs less
and does BY FAR much more. Same with Aladdin, Imagine,
Caligari, etc.

|> ASTOUND $249
|> Strata Vision 3d w/
|> stsrata Virtual $499

If I rember correctly, it doesn't do animation and
lacks some features too.

|> Logomotion 3D $109

Could be good or really bad. I'll check it out.

|> cameraman $95
^^^^^^^^^^
?????

Well, Peter, so far you are proving my point yourself.
I wonder if you have used those programs in order to even
think about comparing them against those in the Amiga.

I'll check Logomotion, cameraman and Strata w/virtual.

2611. Old ST - New Tricks

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-26 18:42:11 UTC
From: jmconnel@oregon.uoregon.edu
Message-ID: <jmconnel-2605941138O1@john-mcconnell.uoregon.edu>
Source record: 16803

Thoughts from an old ST junky,

I'm currently enjoying a 'rebirth' into my atari st 520STfm. It's been several years since I've used it seriously and now (after much upgrading - 3MB RAM, TOS 1.4, HD, Spectre GRC, and my new HP DestJet) it's an enjoyable machine. Maybe if Atari had advertised (in the U.S.) we'd all be speaking AES and VDI instead of Windows (yeck!) or Mac OS. The ST vs. Mac vs. PC story seems similar to the current OS/2 vs. Windows situation. OS/2 is so obviously the superiour OS yet IBM is doing too little to convince the average user to buy it. Windows will be the OS of the future-not OS/2.

BTW, the Apple PowerPC will not up seat Pentium because 90% of it's operating system is emmulation (only 10% of the tool box routines are written in native RISC code!) and emmulation doesn't sell computers (just ask Comm. and Atari).

Also BTW, the IBM PowerPC will fail for the same reason that there line of PS/2's failed. I'm just saying this because the HD on my PS/2 model 70 just failed and the cost to replace the IBM propriety HD is about 60% of the cost of a new 486 clone. Looks like my IBM, super special micro channel, computer of the future, is going to the garbage dump....

Note: There are things I like about Windows and I hope both PowerPCs succeed and obviously I enjoy Macs or I wouldn't own a Spectra.

~John "Remember When" Mc.

There is an updated version of the Atari TCP/IP FAQ available. I have sent it to a.a.u.e, ftp.uni-kl.de, ftp.tu-clausthal.de and it should be appearing on other sites afterwards. If you do not have access to getting files across the net, send me mail and I will mail you a copy.

If you see anything that needs to be added please let me know.

Also please take the time to pass this information on to Atari owners that are not on the net.

Thank you all for you help and interest.

Eric March! Are you the guy who wrote FANSI? VERY impressive program indeed. After I wrote ANSITerm, the idea sorta lost its charm so I never got around to writing an ANSI drawing program... but I would have NEVER done such an impressive job. Very nice work! I would suppose our ANSI character drawing routines are as fast as mine, or at least comparably so... want to compare source code?

What surprised me was that you never mentioned ANSITerm at all, seeing as how if you want to SEE ANSI drawings (some of your examples are VERY impressive), then you'd need ANSITerm if you're using a stock ST. Since our shareware fees are the same, would you like to trade a registration key for a registered copy of ANSITerm 1.91?

C.A.I.N., a new Atari online magazine, would like to know which compression method should be used in compressing the newsletters...please take a moment to send your preferance of compression formats...you may "write-in" a format that is not listed...if this is a machine specific format, please indicate which machine this format is for...

Thank-you!

To vote simply reply to this message or send e-mail to "aa338@po.cwru.edu" ...

Unless you're "writing-in" a vote, please send the number your choice corresponds to...

Please have the word "vote" somewhere in the subject line.

Finally, please do not request newsletters from this e-mail address. If you would like to receive the latest copy of CAIN, you may send a request to "xx004@po.cwru.edu" ... You may request the latest issue only, or request to be placed on the e-mail subscription list...

--------------cut here---------cut here-----------cut here-------------------

Which compression format do you prefer CAIN to use?

Vote Options:

1. ARC
2. ARJ
3. LZH
4. Super ARC for Atari 8 bit
5. Unix compress Z
6. Zip PKWare etc
7. gzip GNU Zip for Unix

2621. Online Conference with Jeff Minter May 29, 1994

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-28 00:33:36 UTC
From: aa338@cleveland.Freenet.Edu
Message-ID: <2s63h0$ovh@usenet.INS.CWRU.Edu>
Source record: 16819
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy,rec.games.video.atari,alt.games.lynx

Just a friendly reminder...Jeff Minter will be this month's guest on the
Cleveland Free-Net Atari SIG's monthly conferences...

Jeff Minter is the author to the Jaguar smash hit Tempest 2000 as well as
such popular ST titles as llamaTron, llamaZap, and Hardcore...

The conference will be held at 7pm EDT May 29, 1994 on the Free-Net's
local IRC, channel #Atari.

Since this is being held on the local IRC, persons wanting to attend must
already have an account...

To connect to the Free-Net:

telnet freenet-in-{a,b,c}.cwru.edu
or 129.22.8.51 or 129.22.8.32

Once connected, at any "Your Choice ==>" prompt type 'go irc' then choose
option '9' to join the IRC. For COMPLETE instructions (you better read this
if you never used the IRC) type 'go atari' at any "Your Choice ==>" prompt
then select option '4' then enter '1364' ... this will present you with a
message titled "Crash Course in IRC" ...

This same help file is available in the may 1994 issue of C.A.I.N. newsletter.

A transcript to this conference will be printed in the June issue of C.A.I.N.

Send e-mail to xx004@po.cwru.edu to request this newsletter.

If you would like to attend future conferences, please apply for an account
on the cleveland free-net...it's absolutely free...Additionally, it'll
provide you free access to our Atari SIG, a very comprehensive resource to
all of Atari's platforms...

Hope to see you all on the conference!

-Mark Leair
aa338@po.cwru.edu

> And he sounds like a baby? Sheesh!

I am sorry(no I am not) that you feel otherwise, but Atari has stated between the lines that the jaguar is their last hope and that attention to the computer line will be zero. Evidence: when was the last time a new model was introed? According to MacWeek, Apple demonstarted a PowerPC daughter board for the Mac LC line at the recent worldwide developers conference. When was the last time Atari had a worldwide developers conference?

2624. Amiga/Atari/Mac

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-28 02:48:07 UTC
From: ericw@okcforum.osrhe.edu
Message-ID: <CqHrs8.CtE@darkside.osrhe.edu>
Source record: 16820

First, who cares about the Mac anyway, unless you have one(and I dont).
Secondly, the Amiga isnt dead. There are enough useres out there to keep it
alive, though no more new machines will be produced. Software and hardware
support might start to dwindle, then guess what? Welcome to Atari World.
Support on the Atari side is little if any at all. But there are enough of
us users that stuff keeps being produced(slow as it is).
Also, Atari did release their last quarter loss statement. yes LOSS,
but it dropped from a 9.8 million dollar quarter loss to a 900,000 dollar
loss. If the losses keep shrinking then guess what? PROFIT!!!!! Atari's
losses are shrinking by the millions and they are doing it fast.

2625. Convince Me to Buy a Falcon for Audio Production

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-28 15:31:21 UTC
From: larry@strauss.udel.edu
Message-ID: <2s7o49$pkg@strauss.udel.edu>
Source record: 16822

Basically I want to configure a digital audio workstation and
I'd like you all to flood my mailbox with Atari propaganda ;-)

Seriously though, I'm a longtime Mac user, I've used Mark of
the Unicorn's Performer MIDI sequencing software since version
2.0 (way back!) on a borrowed Mac but I need to jump into
digital audio and will have to get a whole new setup.

The price comparison on a Falcon vs. a comparably equipped Mac
with DSP board is sizeable. A quick rundown of the things I
need showed me it could be as much as 20% more for a Mac
setup, though I'm not all that certain I've got everything
need for the Falcon down. Thus I'd like help. I'd like to
hear from users of Cubase and Logic Audio - all the joys AND
tribulations of their setups.

I need:

* 6 - 8 tracks of digital audio controlled from within
sequencer. I'm leaning heavily towards LOGIC Audio,
but would like to hear about CUBASE Audio.
* The ability to have digital I/O (AES/EBU preferred, but
S/PDIF is OK)
* The ability to control an ADAT via MMC (MIDI Machine Control).
* Digital transfer between ADAT and computer would be way cool.

- What pieces do I need for a Falcon setup?
(really, assume I know NOTHING about a Falcon: what kind
of video, is RAM good old 30-pin SIMM memory or ???, etc.)

- Where should I buy it here in the States (East Coast)?

I've posted a similar query to the LOGIC-users group, but the
Mac people seem to be in majority over there.

I've skimmed the "Mac rules, Falcon sucks" threads and don't
want to hear anything on that level. I've used Macs since
they were called "Lisa" ;-) and know what they can do. I have
Power Macs aplenty at work. I need to spend MY money and want
to hear if I can do serious audio production work at a cost
savings with a Falcon setup.

Thanks!

Nick, I've heard the same rumors too. So here goes people...

I have a friend, who has a source at MOTOROLA who says they have seen the new FALCON 3. This beastie has the power pc chip. This source also stated that they were looking into using our GEM as some kind of operating system for the Power PC over there at Motorola...

Now don't everyone mess their pants all at once now, darned, soiled again!

Remember, you heard it from, ATARI MAN!

2628. SMS2 and MINIX

Newsgroup: comp.sys.atari.advocacy
Date: 1994-05-30 10:42:01 UTC
From: rdzidlic@faui06m.informatik.uni-erlangen.de
Message-ID: <2scftp$123@faui06m.informatik.uni-erlangen.de>
Source record: 16829

Hello,

for those complaining about SMS2 filesystem there was a project
to run MINIX and QDOS processes in parallel.

As far as I can remember, MINIX68k software needed only a small
patch.

I have seen the diffs and it should work fine on SMS2 if recompiled
with a newer C68.

Surely, if MINIX were PD and the QDOS multitasking not so nice
it would be very interesting.

Bye
Richard

Do you know anything about the SINCLAIR QL ? I have one and need to find documentation, as I accidently unplugged the keyboard power cables without noting which colors when to which sockets. The reason I did this was that the shift keys would not work for some reason. Is there a SINCLAIR Newsgroup ?

thanks

Please, NO flames, this is a serious question...

I know that the Falcon is made by Atari and that it is a computer. But what are some of it's strong points and weak points? What are it's specs (RAM, hard drives, CPU, etc)? I'd really like to know.

Has anyone seen this working? It sounds quite interesting. I'd heard about it, but I'd also heard that it had been delayed and thus forgot about it while waiting for further information. But that was ages ago.

Err, what do you feel is missing from Minix (or Unix in general) that QDOS has in terms of multitasking support?

-> Eric March! Are you the guy who wrote FANSI? VERY impressive
-> program indeed. After I wrote ANSITerm, the idea sorta lost its charm
-> so I never got around to writing an ANSI drawing program... but I
-> would have NEVER done such an impressive job. Very nice work! I
-> would suppose our ANSI character drawing routines are as fast as
-> mine, or at least comparably so... want to compare source code?

It is indeed me ... actually, my character drawing routines are unbearably slow compared to your routines. I "cheat" a lot when it comes to drawing characters. (i.e. when a character is placed down I overlay colours manually point-by-point, then grab that character from the screen and make a note of it ... so that if the user lays down another of the same character in the same colour scheme I just put down that character again; no need to redo it all over. I do a similar thing with LINEs, and with BOXes, I draw one line horizontally, then copy that line vertically until it gets to the bottom of the box the user has drawn) From what I can tell, all of your routines are done on the fly... and FANSI can't even hope to compare with that on a stock ST. (Maybe on a Falcon -- FANSI absolutely flies on one of those, but on a stock ST, if you saw my drawing routines without the cheats, you'd fall asleep waiting for an ANSI pic to be displayed on screen... :-)

I'd love to compare source code ... but I don't program in C, and I doubt you'll find anything interesting in my code, either. :-) I'm glad you like it, though ... it's a shame that you didn't get around to really updating ANSIterm; I quite like it and use it exclusively (giving up STalker for it, since ANSITerm is friendlier on RAM on my sorry 1 meg system. :-) But glad you like the program ... it's taken me a little longer than I thought it would to get it done and out, but once it was final and complete I was quite happy. I demoed it at a local user group meeting and it seemed to have impressed folk ... and there seems to be something of a stir happening on GEnie about it. (I just wish I had an account there. :-)

-> What surprised me was that you never mentioned ANSITerm at all,
-> seeing as how if you want to SEE ANSI drawings (some of your examples
-> are VERY impressive), then you'd need ANSITerm if you're using a
-> stock ST. Since our shareware fees are the same, would you like to
-> trade a registration key for a registered copy of ANSITerm 1.91?

Hmm. You know, now that you mention it I DO distinctly remember forgetting a few things in the info scroller. The scroller in 1.00/1.01 is actually a re-write... the first version I thought was a little bland, but it DID mention, among other people, you and ANSITerm. Damn... I always forget something when I redo it. I'll be sure and

correct that oversight in 1.10 which should be out in a few weeks, hopefully. (I'm just doing up the prefs menu now, and considering what else to add for 1.10)

Swap registrations? Sure! I've been cursing myself for not being able to register ANSITerm ... I mean, I use it religiously (considering my vested interest in ANSI, and the fact that I like it anyway ... no really fancy frills that I could do without, just a term program, and a fast one at that) and I kept reminding myself to register ... but one thing or another kept sapping my wallet dry, so just keeping my head above water was enough fun. :-)

Gimmie a call and we'll swap registered stuff ... I can give you a key over the phone. My number's in the docs in the registration portion.

Try comp.sys.sinclair. There's some stuff for anonymous ftp at
maya.dei.unipd.it [147.162.13.1] --- look in directory
/pub/pub/sinclair_QL.

It's possible to persuade gcc to produce output suitable for QDOS (and
thus for SMS2) but at present the C68 libraries need a bit of work.
However, you need fairly substantial resources to run gcc at all...

>I must definitely flame this, c68 available for QDOS and SMS2

>AND ALL relevant GNU utils ported(except gdb, this is a real
>drawback)

Hmm. GNU Make is a relevant GNU utility which AFAIK hasn't been ported to
QDOS/SMS. (Picky, picky...) Porting gdb would be nontrivial.

>The library makes great effort to make porting unix programs
>easy, only differences are in fork/exec and this is much more

I'd very much like to hear what you think is missing from Unix in the area
of multitasking support that QDOS/SMS2 has.

>Xwindows is not ported, nobody attempted to make it work with
>a QL (<2Mbytes in the vast majority).

I shouldn't imagine an X port is very likely.

>Otherwise it should not be a problem.
>
>The provided window system is very easy and extremely effective
>to use - makes intelligent use of the keyboard, pointer/window
>placing strategies etc..

Provided the programmer is intelligent, just like with GEM and any other GUI it's easy to produce hideous and botched programs.

>>> How similar to Unix is the multitasking?
>
>c68 libs make it appear very similar,

Err, I'd say they make it appear fairly different, actually. Look up what fork() is supposed to do on any Unix system and then say c68 does anything remotely similar. The exec..() calls all take extra parameters in the C68 libs that aren't required by the Unix versions. Also there's no signal support as such, and signals are quite important to multitasking under Unix.

>otherwise very different,
>extremely fast job-switch (about 0x68 bytes context information
>under QDOS)
>
>>IMHO don't bother. I've had a bit of experience of standard QL QDOS
>>(which as I said I *believe* SMS2 to be an enchanced port off, and in most
>>ways it has no advantages over TOS/MiNT or MINIX. Its only advantage would
>>be its compactness and efficiency.

If you _already_ like QDOS and have an ST (for whatever reason) then you probably should bother. Otherwise, if you want a fast, compact multitasking system which, although it can't run TOS/GEM programs does already have a software base, you might be interested. You'll have to get used to another way of doing things, but, no pain: no gain.

>some advantage is the THING system.

Currently Things are most widely used for supporting resident programs and a standardised format of extension (i.e. a kind of shared library.)

Modern Unix implementations are quite good at code-sharing too. However,
you need extra hardware to perform the particular trick I'm thinking of
(i.e. a MMU.)

>but thats all.

If you look at the system call interface for SMS2 you will find large chunks of it are essentially the same as that of QDOS. Hence it will run some QDOS programs. However, it is not a QDOS port in that the underlying operating system does many things in completely different ways. (e.g. the job control block is somewhat different.)

If you want QDOS running on an Atari ST, that's possible as well, though you need an extra bit of electronics to emulate the Ql's display modes for this to be useful.

SMS2 users will want to know which QDOS programs they can use. The answer is: some. One can divide QDOS program into three categories.

1) games --- you can be pretty sure that what QDOS games there are won't run under SMS2.

2) old-fashioned programs --- programs written many years ago, or programs written as if they were written many years ago. Many of these won't run under SMS2 because they makes invalid assumptions about QDOS. (That may sound odd, but it turns out that they won't work under certain versions of QDOS either.) This sort of program is becoming rarer and rarer, but they're still around.

3) modern programs --- usually easy to spot since they use a GUI interface very similar to that found under SMS2. If you have one of these then it's quite likely that it will work under SMS2 as well as QDOS.

The acid test, of course, is to try the program in question and see; though that's a bit annoying if you've paid money for it and it doesn't work...

Nothing missing from Unix in general - sure you will find any
feature in some unix...
What I wanted to say there is nothing missing in QDOS/SMS*
In particular in minix some features eg 'nice' were not built in
and required a change in the kernel. Indeed this is a very old
information.

But the /proc FS as in Linux is something that might be
interesting even for QDOS. How about manging THINGS this
way?
And it could be fun for example to mount some Linux filesystem,
they have filesystems for DOS to and maybe other fromats.

bye

I don't think this belongs at all in comp.sys.atari.advocacy, so followups
to comp.sys.sinclair only unless perhaps it drifts back in the SMS2
direction...

Minix is not *necessarily* the best example of how all Unices work...

>But the /proc FS as in Linux is something that might be

Err, a device driver would be much more suitable. I suggest we take this idea to mail... It's probably not of interest to more than a small number of people.

>And it could be fun for example to mount some Linux filesystem,
>they have filesystems for DOS to and maybe other fromats.

Err, being able to 'mount a Linux file system' does not mean 'being able to mount a DOS file system'. I'm not sure that's what you meant?

Not very good expressed myself. I wanted to say that usualy
fork/exec on QDOS does what several lines of code do in unix
Of course there are things you can not do with C68 fork.

There is of course the old TOS emulator for QL Dave used
for porting the C compiler, only very well behaved
TOS programs could use it

Bye
Richard

2647. Re: I've heard rumors, too!

>Remember, you heard it from, ATARI MAN!

Get more info from your friend!

I'm facing a large decision, and the way things end up looking for Atari in the next few months will greatly determine the course of my life (ok, it's not quite that big...)

I've been an Atarian for 8 years or so now. I have a TT030 with 8 megs, 500 megs of HD, Nova 16m VME graphics card, Philips 1764DC 17" monitor, Supra 14.4, and HP DJ. What I really like about Atari is the graphic interface and the user community. (Please, no flames here; I know the alternatives well and have chosen by my own free will) This has been enough to stave off doubts for the past 8 years. But, though Atari has never been in a very good financial state nor have they ever dominated the market, now seems to be a particular turning point in their history.

Basically, my situation is this:

I'm going to Alaska for the much of the summer. I will not need my computer during this time. Therefore, I think it is wise to sell it (because computer equipment devalues with time much faster than money). In the fall, I will buy a new computer. It will most likely be a Power PC machine; most certainly not an Intel machine. If Atari happens to have one available by then, I will buy it. If not, I will probably hold out for a Canon or IBM, or possibly PowerMac if they've conformed to PReP by then...

My uncle owns some Atari stock and he just got the annual report. He says it sounds very grim. They at least imply if not outright say that they will no longer be making computers and that they will concentrate only on the Jag. According to the report (thru my uncle) they have already stopped production of all TTs and Falcons; a few are still trickling in from warehouses and manufacturers' built-up inventories. On top of that, the Tramiels have cut pay for much of the management, Bob

Brodie is gone, and they have said they do not have the funds to properly roll out the Jaguar.

On the other hand, the rumors about the PowerPC-based Falcon are very strong; much as the Falcon and Jag rumors were before they were introduced. Of course we can't assume anything by that... from your post, it sounds as if Motorola is making the PowerFalcon!? Recently, Atari has liscenced TOS and GEM for use in the Medusa and Eagle. This was unheard of until now. The evidence seems to be pointing toward the handing off of the TOS-GEM computer rights to someone else. This has the potential to save Atari computers.

In any case, in the fall, I will buy the computer that looks the best to me then. I hope it is at least TOS/GEM compatable.

I want to hear more rumors. Even wild fantasies (as long as they are labeled as such...)

Dan Aylward
dud@u.washington.edu

Richard Hecker (richard.hecker@canrem.com) wrote:

: -> Eric March! Are you the guy who wrote FANSI? VERY impressive
: -> program indeed. After I wrote ANSITerm, the idea sorta lost its charm
: -> so I never got around to writing an ANSI drawing program... but I
: -> would have NEVER done such an impressive job. Very nice work! I
: -> would suppose our ANSI character drawing routines are as fast as
: -> mine, or at least comparably so... want to compare source code?

: It is indeed me ... actually, my character drawing routines are
: unbearably slow compared to your routines. I "cheat" a lot when it
: comes to drawing characters. (i.e. when a character is placed down I
: overlay colours manually point-by-point, then grab that character from
: the screen and make a note of it ... so that if the user lays down
: another of the same character in the same colour scheme I just put down
: that character again; no need to redo it all over. I do a similar thing
: with LINEs, and with BOXes, I draw one line horizontally, then copy that
: line vertically until it gets to the bottom of the box the user has
: drawn) From what I can tell, all of your routines are done on the
: fly... and FANSI can't even hope to compare with that on a stock ST.
: (Maybe on a Falcon -- FANSI absolutely flies on one of those, but on a
: stock ST, if you saw my drawing routines without the cheats, you'd fall
: asleep waiting for an ANSI pic to be displayed on screen... :-)

I didn't notice the slowness, but a friend of mine did. He and I figured that
you stored a bitmap of the screen in your data files.

: I'd love to compare source code ... but I don't program in C, and I
: doubt you'll find anything interesting in my code, either. :-) I'm
: glad you like it, though ... it's a shame that you didn't get around to
: really updating ANSIterm; I quite like it and use it exclusively (giving
: up STalker for it, since ANSITerm is friendlier on RAM on my sorry 1 meg
: system. :-) But glad you like the program ... it's taken me a little
: longer than I thought it would to get it done and out, but once it was
: final and complete I was quite happy. I demoed it at a local user group
: meeting and it seemed to have impressed folk ... and there seems to be
: something of a stir happening on GEnie about it. (I just wish I had an
: account there. :-)

Actually, my drawing code is written in assembly, and it can be worked up so
that you can interface it to GFA Basic. But you'd need an assembler. I could
give you this routine for a negligable fee.

Even in GFA, you could do faster then plotting pixels. You could do it with
some bitshifting and poking a lot faster.

: -> What surprised me was that you never mentioned ANSITerm at all,
: -> seeing as how if you want to SEE ANSI drawings (some of your examples
: -> are VERY impressive), then you'd need ANSITerm if you're using a
: -> stock ST. Since our shareware fees are the same, would you like to
: -> trade a registration key for a registered copy of ANSITerm 1.91?

: Hmm. You know, now that you mention it I DO distinctly remember
: forgetting a few things in the info scroller. The scroller in 1.00/1.01
: is actually a re-write... the first version I thought was a little
: bland, but it DID mention, among other people, you and ANSITerm.
: Damn... I always forget something when I redo it. I'll be sure and
: correct that oversight in 1.10 which should be out in a few weeks,
: hopefully. (I'm just doing up the prefs menu now, and considering what
: else to add for 1.10)

: Swap registrations? Sure! I've been cursing myself for not being able
: to register ANSITerm ... I mean, I use it religiously (considering my
: vested interest in ANSI, and the fact that I like it anyway ... no
: really fancy frills that I could do without, just a term program, and a
: fast one at that) and I kept reminding myself to register ... but one
: thing or another kept sapping my wallet dry, so just keeping my head
: above water was enough fun. :-)

I've run up too much of a bill as it is. Email me from the address you'd like
me to mail to you and I'll give you my phone number. I'll setup a registered
version of ANSITerm for you, uuencode it, and email it to you then.

: Gimmie a call and we'll swap registered stuff ... I can give you a key
: over the phone. My number's in the docs in the registration portion.

Dear Sir,
In a recent survey we discovered that most computer literate
people do not own a entity/soul/mind Biological Unit (a.k.a. a life).

Therefore we are pleased to announce our company's new product :

----------> *LIFE* <----------

LIFE (Tm & Copyright 1994) is available from all good suppliers at an
amazingly
low initial cost. There are many different models available ranging from the
"Very Little" model to the "Wow This Is Such A Great Time" model.
If you are interested in purchasing a LIFE then please contact your local
supplier.

Thank you

> INFORMATION.

This is Advocacy! I am sorry, but I will comment when Atari Droids speak lies about the Mac as a fact, instead of an opinion. Atari can come out with crap such as the Portfolio and Atari worshippers will praise it and state its the best thing since slice toast, because of the Atari logo. But, when Apple comes out with the Newton, these same worshippers ridicule the product instead of constructive Criticism.

> Your comments are unwelcome, they are highly biased, and most of

>

See this is your opinion and does not reflect the mood of the entire community. I am not enforcing comments on anyone. In what way are my opinions are wrong. Oh, but it's okay for you and Atari droids to flame System 7 and the Mac as a fact but not an opinion. Again, you are making an opinion, I will continue to post here and there is nothing you can do about it..

Oh, by the way, I have recived mail from Atari owners who want to know more about the Mac Because of the lower prices. "Costs this little for so much".

SO, YOUR ABOVE FEELINGS ARE AN OPINION!

You can correct errors all you want but stop posting flame bait! I can't
speek for portfolio but the Newton is crap. It is too expensive and does
too little. In ten years everyone will have one but for now it's pretty
useless. Also, mac fans tend to worship anything with an apple logo on it.
Like the Newton.

>See this is your opinion and does not reflect the mood of the entire community

Well, I'm a mac person and I hate your posts here! They tend to be inconsistent
and more about flame than fact. You can make flames about System 7 without
resorting to opinion; ie System 7 has no memory protection, no pre-emtive
multitasking, takes more than 5Mb disk space, takes more than 1MB RAM,...
About you posting here: why would you post to a group that doesn't wish
to here you comments. I've made anti-Atari postings and no one has asked
me to leave.

>Oh, by the way, I have recived mail from Atari owners who want to know more
>about the Mac Because of the lower prices. "Costs this little for so much".

If they where interested they should have checked the comp.sys.mac.*
groups.

I didn't mean to imply that I thought SMS2 was a port of the QDOS OS. I
meant 'implementation' in the sense that SMS2 implemented QDOS functions
thus allowing some QDOS programs to run. In the same way that DR DOS
implements MS DOS functions - but isn't actually a port.

This guy is too funny. So, if you, Atari users, just like me, are tired of reading this clown or making 'Author Kill', I suggest we leave this newsgroup and go to talk about Atari in comp.sys.mac.advocacy. Because sinclap doesn't post anything there.
I also suggest that we stop replying him, because this egocentric Mac psychopath seems to be too happy when someones replys to his poor babbling.

Could you explain your reasoning here? I think its rather more
likely that 10% of the application's code will be executed 90% of the
time, involving calls to the emulator, involving huge overhead (even
with the 'native' routines).
I may not be an expert, but your comment makes little sense to
me. I think I need an explanation.
Of course, it may simply be that the '90-10' rule-of-thumb
doesn't apply to applications running on operating systems running on
emulators running on operationg systems. It is only a rule of thumb
after all, otherwise we'd all be able to get caches of precisely the
right size.

Duncan.

Yes... The purpose of DRDOS is to mimic MSDOS as close as possible,
however, and presumably add some extra bits. Whereas SMS2 is (or so
we're told) supposed to be able, in time, to do quite a bit more than
QDOS.

(Compare SMS2 with SMSQ, which is a re-implementation of QDOS from
scratch which is supposed to be as close to QDOS as possible.)

What he means is that only 10% of the OS routines are called with any
frequency. These have been rewritten in PPC code. The other 90% of the
OS is either rarely used or not time critical. The File Manager and the
SCSI drivers have not been rewritten yet and they ARE time critical but
aside from that Apple has rewritten the important stuff.

Yah, he also just retired from the Mint mailing list a couple days ago; due
to lack of net access. In general, when you want to contact us, you should
use the advertised aliases, not emailing to a specific person. We all check
in at varying hours, so emailing a specific person reduces your chances of
getting a timely response.

So everyone, burn these addresses permanently into your brain's EAROM....

atari-archivists@atari.archive.umich.edu
mint-request@terminator.rs.itd.umich.edu

Also, if you are sending a message to the mint mailing list, you don't need
to also send it to mint-request, (i.e., don't cc: it) we already get everything
sent to the list...

2668. R.I.P AV Macs?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-06-05 05:45:08 UTC
From: aspect@cats.ucsc.edu
Message-ID: <2srop4$ss9@darkstar.UCSC.EDU>
Source record: 16767

I just heard a rumor that Apple will be discontinuing the AV Mac line in the Fall. Gess they aren't selling well enough for Apple.

Just goes to show how I feel that they have lost their vision and are now just another company shooting themselves in the foot for the bottom line. If they had put the AV tech into all machines as the "next generation" thing, that would be good, but by introducing it as a sidelight technology it was doomed to fail form day one. Will we Atarians once again be able to say that our Falcons are the only DSP equipped machines currently made?

I considered posthing this to comp.sys.mac advocacy too, but I know there is enough chance of flamewars starting here with the mac-worshippers we have "slumming" as it is...

~Chris

p.s. if it is true, can I laugh at sinclap? Hell, I guess I can laugh at him anyway...

Do you mean the DSP equiped 68K macs or all the macs, including the 601 based
macs? I can see the 68K based macs w/DSP being dropped in favor of the 601
based macs. But if they just drop AV then, yes, they have no vision.

Followups to comp.sys.sinclair only, this has about as much to do with Atari computers as cabbages... Sigh.

Sysop <sysop@teaminfinity.com> wrote:
>Was there a modem for the QL ? What about Communications
>software. How else would one be able to download QL stuff
>from the FTP sites ?

Err, why not ask on comp.sys.sinclair? You might find more people can answer your questions that way. Keep posting Sinclair-only questions on comp.sys.atari.* and people will start getting annoyed...

There were modems specifically for the Ql tho they've been out of production for a long time. It might turn out to easier and cheaper to simply connect the Ql to a net-connected computer via the serial ports and transfer data that way; though there are various other ways of doing it.

No, they are not dropping the AV Macs. They just won't have DSP's in them
anymore. The reason? Because the PowerPC chip can do the same thing the
DSP's did, but much faster.
They did just say that they will be coming out with a new computer the
first of next year. It will have a 120MHz PowerPC, up to 750 megs of ram
and a full PCI bus. Though at current prices, if you fill up all that RAM,
it would be over $40,000!

I don't think slice toast is that revolutionary. It makes the whole loaf feel sloppy, and it gets defected to quick. About this Portfolio vs Newton, I believe this is not a relevant comparison. The Portfolio is a strict computer, the Newton is sort of a mix between a computer and a portable notebook. The critisism of the Newton is usually aimed at the notebook part of the machine, where the Portfolio hasn't even got the possibilities. Personally I think the Newton probably is a great tool, but on the computer part, it is kind of limited compared to the Portfolio (IMHO)!!

Source record: 16775

Interesting sideline here - the Acorn RiscPC (just released) blows the PowerMac out of the water in terms of speed, price, and compatibility. Comes with a 486 processor in the same box, sharing the same RAM & Video. Has better gfx than a PC or PowerMAC (programable rez up to 1600*1024 as standard), runs native RiscOS programs & PC programs (including windows) on screen at the same time - not using a software emulator, but using an actual 486 chip so the PC stuff runs at full speed as well....

Want Unix & X ? They're available.
Want networking ? It's built in.
Want sound ? 8 channel 16 bit stereo will do to start with.
Want colour ? 16million as standard.

The cost ? A mere 1299gpb retail for a system inc. monitor & HD (210Meg). You're lucky to get the PC on it's own for that much.

Main CPU is an ARM610.....

AND IT BRITISH.......

Now - bugger off and play with your Macs - bloody american rubbish, just like the PC :)

(esp. P.S-Day - what a pillock).

>

It is my understanding that Apple is dropping the 68040+DSP Macs precisely because of the PowerMacs (601,603,605,...). The PowerPC chip, in native mode, can outperform the AV Macs on any task, and with very little difference in price, there is simply no reason to buy an old CISC-based machine for such high-powered uses.

I have also read (and certainly believe) that Apple will be completely ending its 680x0 line of machines within a few years in favor of PowerPC. Since PowerPC is powerfull enough to give rise to whole new user interfaces, this is hardly surprising.

By way of introduction, since I haven't posted here before:
I'm a grad student at Michigan State University writing to you from a MegaSTE w/4Mb RAM and an external hard drive. Under my T.V. is my older 1040STfm, and under my table is an old 800XL (have to get a new keyboard). I have been an avid Atari supporter ever since my family bought our first 16Kb Atari 400 (you know- the one with the membrane keyboard), and was once an avid Mac/Apple hater.

That's changed a bit since Atari slowed down its support of us users, and Apple seemed to work most of the bugs out of System 7.1; I work on 7.1 a lot, and have almost no crashes, unlike the old 6.0x, which would choke at least once a day. Which leads me nicely to my next comment:

If anyone is interested in buying a MegaSTE system sometime in the next few months, Email me. I'm looking at buying one of the PowerMacs sometime fairly soon, and need buyer. It's a complete system, with gobs of software. Please note, however, that I won't necessarily sell when it's convenient for you (I still need my system for my own work), but I will keep a list of those who may be interested.

Adios!
-Tom Hopper

CEO file contents:
Hi,

I heard Apple were working on a brand new V-RISC chip (Very
Reduced Instruction Set Chip). Here is what I heard of it from
developers.

-Very fast processing : Speed depending on associated quartz
up to 500Mhz

-Low energy consumption : No more overheating

-Easy integration in existing architectures. (IBM has already bought
the license. Atari is studying it for it's next generation of
computers...)

-Low production cost.

-Only 2 pins.

-Easy programming : only one instruction (NOP)

Sounds like the perfect processor for the next millenium's computers.
I've even managed to get a simplified diagram of it's architecture :

--============================--
+5v isolation GND
pin coating pin

I think it's name is PowerPCW (Piece of Copper Wire ;)

Er... Sorry for wasting bandwidth :)

Bye,
Nick.

Yeah, but can the NEC chip cook hot dogs?

I bet we could add a self-destruct instruction by having a large capacitor
in like with the PowerPCW so that any Amiga user could easily take out
their pent up aggression on Apple products by pressing a button. Dump a
large voltage and current through it and it would explode nicely! ;-)

The DSP performance of AV macs and the performance of the PPC's own MultAcc instruction are about on a par; the AV version of the PowerMacs is simply a PDS card that adds video ports, and things like that.

-Ben

Thank you! Yes! I beleive we have reached a new plateau of conversation
level in this newsgroup!! ;)

BTW, I have completely ignored your followup to this post, and am
forwarding it to many other people so they can ignore it too. :):):)

>Oh, I forgot. It's not from C=, so I guess it sucks.

I see several distinct possibilities here:

1. You're trying to be a "straight man" for the
original poster's humor.

2. You have no sense of humor and didn't get the joke.

3. You're an idiot, and didn't get the joke.

Just thought I'd have to say something on this new newsgroup.

An old 520ST and now Falcon, Lynx II and soon to be Jaguar (UK) owner.

Oh. I did buy a portable Triumph Adler 286 IBM-clone last year for
2 obvious reasons. It was really cheap and I can advocate Atari
from a comparative standpoint rather than blindly. Oh, I can also use
it for working on the move!!

Hi great ignorers !
I am really honoured to ignore this posting. It was a pleasure.
What about a new newsgroup comp.sys.atari.ignore ?

I'm happy to tell you it's already here, and it's called comp.sys.atari.*.

Umm. Sorry. Ignore that one.

Dan.

Sorry Brian, but I have ignored this message too!

alex.

PS. Isn't it great to have such a great thread in all those
groups? (tip: take a look at the cross-references :-))

I think this news group sould be renamed to "Sad Buggers Incorporated".
However, you'll probably ignore this posting as well.

Sorry, can everyone repeat the above as I ignored it, and I enjoyed it so
much that I want to ignore it again.

I just had to add my own contribution to this wonderful thread,but if you
don't like it then you have my permission to ignore,and pass it on so
your friends can too.

But if you ignore it on a regular basis then can you please send me the relatively small amount of 10 pounds. Quality ignores like this are often far more expensive, so it's quite a bargin!

:-)

I forgot what it is I'm supposed to be ignoring.
I don't suppose the original sender wants to repost his message
so I can ignore it properly?

Hahah I would just like to say that I am really getting a kick out
of this ignoring thread... much funnier than the humor newsgroup
I was reading earlier. Of course, my sense of humor could be a little
twisted. ;)

In July, The Falcons price/performance/capabilities willget even worse when the new 630 series Macs are shipped.

Mac 630's features...

-040,33 mhz.
-four direct connect slots
-250 to 350 meg HD storage
-IDE and SCSI
-Apple Talk network
-Dual Speed CDromdrive

Prices: 4/250 config will cost $1272 list and $1545 for 8/250 with cdrom.

Falcon 030(1990 Technolgy) Still $1299 with no future.....

I could argue that as a 486 is built in then windows/dos software *is* native.
To limit your terms of reference to just what the ARM610 can do is a bit like
ignoring what the DSP on the falcon can do.

One would guess that in the terms you were trying to talk about there is a
much software for the Acorn machines as the Falcon.

Having said this, however, I am not sure the 486 is built in. I think it costs
an additional GBP100.

2729. ST/Falcon software market (Was: GOAL! - buy this game)

Newsgroup: comp.sys.atari.advocacy
Date: 1994-06-15 16:19:48 UTC
From: Bales_N@CIRAD.fr
Message-ID: <9406152258.AA00047@montp.cirad.fr>
Source record: 16730
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.st

CEO file contents:
Hi Dino,

Perhaps 50000 Falcons doesn't make a _large_ market, but there must be
a few million STs out there. Not all users have switched to another platform.
And if the Falcon was correctly software supported most of these users would
upgrade to Atari's Big Bird.

Now, my point is that it can't be _that_ difficult to make your
software ST/STE/Falcon compatible. Now, is it really _much_ more work to just
add to this Falcon sounds/graphics ? DSP stuff and Falcon-only could come a bit
later.

Now look at whats happening on the Amiga. LOTS of people are stuck with
A500s or even A1000s, and there are the new 600s and 1200s with new chipsets.
Do you think developpers are considering 1200s as one single market ? They
just make there software range-wide compatible, and sometimes AGA enhanced.

Can't we just do this. The Falcon is not a market YET. The Atari range
IS a quite big one. Go and ask Konami/GameTek how many Frontier copies they
have sold in the "dead" ST market. Same for Civilisation, and probably soon for
Cannon Fodder.

Put out good ST/Falcon compatible games and they WILL sell for more
than 6% on this software starved market. This figure is for the Mac/PC flooded
market. It just CANNOT apply to a market where user are enthusiasts.

Come on, keep supporting the Atari !

Bye,
Nick.

Hey, what is this? Totally out of the blue, unprovoked, you give specs on a
Mac, then proceed to bash the Falcon WITHOUT EVEN GIVING SPECS for it too.

Rumor has it (source: ST Informer Magazine) that a company is looking into a 040 Falcon clone. The article went on to state that Atari was ticked because they haven't released their new Falcon line yet. With Apple's lack of demand for the 68040, the article said that there was a glut of these chips which would allow for a very cheap Falcon 040. I am not saying that this rumor is true, just reporting what I said.
Okay, Peter (sorry, guys), what does this 630 offer? Does it have a Power PC processor or just the 68040?

Atari has 040 Falcons on the drawing boards? If so, bring these beasts out to make the industry interesting. Competition is good.

The Mac 630's will have a cheap PowerPC daughter board. My Duo will be getting a Power PC upgrade in the near future.

What you don't realise is that this is only a quoted figure with no real facts,
I have 3 machines, does that meen I buy 3 copies..??

I think most of these Ataries are in the basement..

The other Real problems is there are no Shops left to sell these games..??

Also here Amigans are getting rid of there machines very fast, some are looking
at the New Acorn PC610 or what ever
its called, leaves a PC clone for Dead..!!

Hmm, I own a Falcon AND think that an Apple IS a nice machine. Where is the problem?
BTW, does PSD get paid for his Apple advertising? Err, I didn't buy a PowerMac, 'cos
it is NOT FULLY compatible with WinDoze, as all the Apple ads will tell us.
FrameMaker doesn't run on the Insignia emulation. Waddayasay?

Atari Advocacy = Atacking and defending Atari computers. Unless I am not reading my usenet header correctly.

I suggest you stop whining.

So you own two orphan products. I have a Lynx too. Atari prez. Sam Tramiel
decided that the Lynx and the Falcon do not deserve the resources to make it
successful. As for the Jaguar- Atari will be lucky if it sells 500,000 in its
first year. Nintendo and Sega sell 500,000 systems a month each. Once the
new systems come out by Atari's rivals with big marketing budgets, the Jag will
sink into oblivion and become a footnote in marketing textbooks.

Why would I want a warehouse full and color illustrations? I can get all the
software I want thanks. It's cheap, it's a phonecall away and it's supported.
Ditto for hardware. I also have a few local shops I can go into to try the stuff.
Withing 10 minutes walk I have 3 shops that I can go into and look at Atari
software and hardware. My HD is full (465Mb) of software. I don't need or want
for anything. I've upgraded my processor to 32Mhz very cheaply. I've added a
copro cheaply. I can add any standard SCSI devices like CDROMs, HDs, removable
media etc. in the happy knowledge it will plug in and go first time with easily
bought drivers. I can multitask using many different OSs. I can look at JPEGs and
GIFs in a fraction of the time my 486 PC takes c/o the DSP in the Falcon. I have
a voice mail system on it, I can go out tomorrow and buy a software package that
will give me 16 tracks of direct to disk recording. I have postscript, I have
vector font technology using an industry standard font technology (Speedo - same
as my X terminal uses as work).

BTW, I'm 30 and don't have wet dreams any more. If I did, they wouldn't be about
computers. I'm balanced mentally, a state I suggest you pursue.

Re Advocacy. Look it up inthe dictionary. To advocate means to say something is
good. This group is for Atari owners to convince others they should have an
Atari. It's not for you to repeatedly piss everyone off by posting stuff about
Macs and to endlessly and very boringly repeat the same crap over and over again.
We are not interested, we do not care, we will not change. All you do is
alienate people. If I'd ever considered buying a Mac (which I did briefly until I
used a few at work), I would certainly have been put right off hem by your good
self.

You can lead a PSD to usenet, but you can't make him think. You are not attacking Atari computers. You are posting Apple advertisements. Saying once that you think the Falcon technology is "too old" for your needs and goung the hell away is advocacy. saying it a million times is stupidity.

Source record: 16658

Wondering which machine I could buy, I went to see the great marabout Mr
Mamadou, who predicted me that Apple was about to die, because of the flush of
new models releases. Also he told me that the Falcon was the best thing to buy
was the Falcon, particularly if editing companies started to release software for it.
Wishing to be sure of it, I decided to consult another fortune-teller. So I went the
famous Sinclap, who herited the divination talent from his father. Sinclap gazed
into his crystal ball and told me the following words:

In article <1994Jun17.084917.28748@cobra.uni.edu>, sinclap2954@cobra.uni.edu writes:
|> >
|> So you own two orphan products. I have a Lynx too. Atari prez. Sam Tramiel

|>

Report #5338, 7/15/93
Dr John Fishman, Grinnell Hospital, Iowa
Patient: Peter Sinclap-Day

JF: So, Peter, tell me about your wet dreams.
PS: Last night, I had a dream. I dreamt that I f<...>ed with the new Mac AV Chamelean, its disk drive without eject button was so sweet. I remember when we <hot stuff deleted>.
JF: Do you often have dreams like this ?
PS: I've had this kind of dreams several times these last few days.
JF: Are you happy in your couple life with your Mac Plus ?
PS: ... <silence> ... Actually, it hasn't touched me for two months.
JF: Mmm... I see. How long for have you had such relationships with computers ?
PS: I think I was thirteen or fourteen. I fell in love with an Apple II. I had to court it for 6 months before we could be alone together.
JF: And what happened ?
PS: It was... It was a bad experience. It was the first time, you know. I didn't really succed. Maybe I loved it too much.
JF: Yes, it's rather usual for a first time.
PS: Moreover...
JF: Yes ?
PS: It reminded me of what they did to me at school, with a Atari VCS joystick <beginning to wheep>.
JF: Yes, I imagine. So, I understand your feelings towards Atari now. I'm sorry to bring back all those ugly souvenirs in memory, but it's the only way to get cured. I think we're gonna stop here for today. We'll carry on tomorrow.
PS: Thank you, doctor.

NEWS>
Group: rec.games.video.atari, Item 11597 (Range: #10853 - #11619, Unread: 748)
Subject: Atari Annual meeting report
From: dagj@netcom.com (Dag Johansen Esq.), NETCOM On-line Communication Services
Date: 20 Jun 94 21:42:21 -0500

I don't know if anyone has posted on this subject yet, but here is my take of what happened.

Just for kicks, I thought I'd drop in on the Atari Annual meeting that was held June 17th, 1994. (It is a 5 minute drive from my workplace.)

The business part of meeting consisted of the Tramiels electing themselves back onto the board. Big deal, they own a controlling block of the stock so there was no surprise there.

The rest of the meeting focused on the Jag. Right now, there are supposedly ~25 titles in development by Atari that will be delivered by Xmas and ~25 titles by 3rd parties that will be delivered by Xmas. To be conservative, they acknowledge that not all of those titles will be ready by then. They said that there should be between 30 and 50 titles by Xmas though.

In the initial NYC/SF rollout, all 20K Jags produced sold quickly. The rough estimates for total 94 sales will be between 250K and 300K units sold.

Time-Warner recently upped their stake in Atari from ~22% to 27%. This was about $12.7 million in capital.

20 Titles will be demoed at Summer CES.

They confirmed that they were working on Jag 2, but they said that it would be backward compatible. They also said that they have some network games in development. Up to 32 Jags can be networked together.

The Jag demo consisted of showing several games and some Cinepack compressed video. I thought the Cinepak was OK, but who cares.

It is not good enough for Movies, and I don't really care about it in games. For quality video, they are going to produce a MPEG cart that will retail for between $129 and $149.

<Usual utter shite from sinclap deleted>
Peter, Apple don't make consoles so why not just fuck off eh? Why have you got this anti-Atari thing? What do we have to do to persuade you you are unwanted? Hire a hitman? Kick the shit out of you next time you go for a walk to get your next bunch of Mac magazines?
Grow up and stop being such a sad git.

I WILL NEVER BUY A MAC OK?

That's what I think too. I think it's not the intelectual level of us Atari-users to argue with fanatic users of other computer platforms.
So let us be open, objective and selfcontient and preserve our energy for things like programming, working, talking, having fun and other things that make life worth living...

The arguments for Atari-, Mac-, Amiga-, Windows-, OS/2-, Unix-, ...-Users are all already said. So don't bother around with fools that have nothing to do but hanging around in other's computer users newsgroups.

I know, why I use my Atari since 5 years.

I seems a bit strange to me that many people, most non-atari owners, belive that the Atari range of computers is dead. If this was the case, then why is there a new Atari emulator for the PC and the new Medusa computer which can run Atari software, and the Jag emulator for the PC?
I think that some people need to re-evaluate their definition of a dying computer!!

Now, now Iain, settle. I too would like to kick sinclap's f%^$#ng little head
in too, but alas, I cannot ...
Anyway, his ploy is working, you are responding to his drivel, so DON'T BITE!
Now if someone would tell us how to use a kill file, I for one wouldn't be
wasting my time with the little fool.

Just for the record - I was using a 10 meg 25 mhz 68030 LCIII color, running
system 7.1 two nights ago (don't ask - I was helping a female ;^> colleague)
and the piece of junk ran about half the speed of my 'lowly' 4 meg 16 mhz
Falcon with MultiDog v1.04 running! Now if I compare it with MultiTos 1.10,
It's about an 8th of the speed!
So ner sinclap! But a LCIII doesn't compare!? Bugger off stupid ... ;^>

Karl.

Yes but the new Apple Mac that got released yesterday (and there are 25 new models coming out over the next month) has a 68040 at 36Mhz, DSP, 19inch color monitor, 1Gb HD and costs 25$. Sinclap being a college bod can get all the software he needs for 3 cents a piece because Mac stuff is cheap and wonderful. AT least that's what sinclap says so it must be true the world over. I can always to the next Mac due in August by which time todays one will be out of date.

True, but how many IBM compatibles are made by IBM these days?

Yes, I agree with you about objectivity. Alas, saying only wonderful things
about Atari would look like fanatism and wouldn't be constructive at all.
Of course, the Falcon is not the perfect computer. The perfect computer exists
only in Sinclap's wet dreams.
Speaking for and against Atari is OK. Posting Apple ads containing Mac prices,
like Sinclap do, is really stupid. What about founding a sect, Sinclap ?

This is right. As long as Atari compatible machines are produced, such as the Medusa (and have you seen the stats for this? Wow!), then the Atari computer won't die out and become obselete. It doesn't really matter who makes them just as long as they are being made.

2773. Re: Falcon's Price/Performance sucks!!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-06-24 15:40:15 UTC
From: sanders@sci.kun.nl
Message-ID: <CrwrJ4.5Bz@sci.kun.nl>
Source record: 16675

Just my $0.02:

I've been considering buying a Falcon from back when I heard the first rumours about them. And if it weren't for my lousy financial situation, I'd have gotten one already.

But in the meantime, things were changing. The introduction of the PowerMac seemed a nice thing, so I've gathered some info on them. I'll come back to them later. PC's are getting cheaper by the day. I've been considering an Acorn machine too. Maybe even an Amiga. Well, after nights and nights of staying awake and pondering, I'm still determined to go for the Falcon. Here's why.

The Amiga offers comparable technology to the Falcon, I think. And the price/performance ratio is also on a par, but if I bought one I'd have to rebuild my software collection from scratch and have to learn a completely new OS. Falcon wins.

The Acorn is a *very* impressive machine, especially their new RiscPC. But I can't afford one, I'm afraid. Furthermore, I know *nobody* who owns such a beast, and since one of my uses for computing is making programs and exchanging them with friends, just for fun, I'd become isolated, just like in the days when I made `wonderful' word processors for my ZX Spectrum 128 which would end up in the closet and gather dust. Falcon wins.

Macs look nice. I can't afford a PowerMac but I can get Macs with 68030@32, 5 M RAM, CD-ROM and big HD, inclusive of color monitor for the price of a 4/85 Falcon w/ monitor. This seems a good deal. But, the same applies as to the Acorn: I know nobody with a Mac, and I have no experience with them so I'd have to learn a completely new OS. And OK, since MacMiNT I *can* use GNU stuff on them, but somehow I still have something against Macs. Everytime I see one demoed at our Uni, it seems to run a lot slower than the processor would suggest. The user-friendliness seems to be a bit overdone here. Working with a Mac is like talking to somebody who is continuously and irritatingly patronizing you with a friendly smile. No sorry, no Mac for me.

And now for the biggest competitor: The PC. I can get a PCI 486 DX2-66, 425 M HD, 4M RAM and loads of stuff for the price of a Falcon 4/85 w/VGA monitor. Peripherals are *cheap*; I can build in a double speed CD-ROM drive for half the price as advertised for the Falcon. Want more memory? Plug it in. Want Falcon-quality sound? Buy me a 16 bit soundblaster and I'm not too far from that. Even when added these extra costs, I'd have a better buy with a PC. At least, that's from judging the adverts. In real life, judging from the *many*

people that I know with a PC, things are not quite that easy. Any system which needs `memmakers' and needs to be *told* that is has extra memory, any system which needs fiddling with config.sys and autoexec.bat to squeeze out those last few bytes, so that an impressive 8M 486 system still reports `largest executable size 540K' makes me frown a bit. I don't like Windows, by the way. Multitasking my *ss. And when installing a soundblaster for a friend of mine, booting into Windows took about 15 minutes (really!) after putting a REM before SMARTDRV or something like that, in his autoexec, as suggested by the installation software.
Apart from all this, I don't like the PC attitude. It is *ridiculous* that a wordprocessor should *need* 8M and a 486 to run. Look at Atari. If my system gets accellerated by 100%, most of the software runs 75% faster. The remaining 25% goes into cosmetics. In PC-world, the newest systems are about 100 *times* faster than the old XT's, but the only time you notice a bit of this is when you type DIR on a large HD. The text really flies past. Wow. All the rest runs just as fast as back then, only now the buttons are colored, text is shadowed, exec size is quadrupled etc. Not fast enough? But a faster computer. I hate that. No DOS for me, no Windows.

The only alternative thus far has been Linux. But for that to run smoothly, I'd need quite a big system with a minimum of 8M RAM (when using X) which would be quite pricey. But apart from that, I don't think Linux is really my way to go. I want my system to be Unix-like, have nice pre-emtive multitasking (I want to TeX in one window, vi in the other, with the dvi file being continuously updated, maybe a bit of downloading as well) but I don't want megabytes and megabytes of code for my simple stuff. I want a clean, small and fast OS. I want to make my occasional program, and TeX a lot, but on Unix systems, how nifty they may be, this seems about the only thing I can do.

Nevertheless, I might just go Linux one day, if Atari still hasn't got anything better in, say, 3 years, when my Falcon is rusty, and Afterburner 040 boards are still just as expensive as my Falcon was.

Sigh. I made my decision, now for the cash...

Greetings.

Sander SToks.

No, it's mail order but then you love mail order stuff for the Mac. It's an ST/TT clone with go faster stripes. It may even be as fast as Apples best. Seriously - it's shit fast and high specced with price to match unfortunately. I'm sure someone else will come along and post the details. I can gtee nothing less than a Power Mac will touch it though.

2775. THE MAC HAS DIED (Unfortunately Peter's still clueless)

Newsgroup: comp.sys.atari.advocacy
Date: 1994-06-24 17:43:20 UTC
From: bjgrier@bnr.ca
Message-ID: <Crwx8B.Hox@nrtpa038.bnr.ca>
Source record: 16676

The one and only store that sold Macintosh's in my area has closed!!!!
The Mac is DEAD! The only thing left is to break out my Spectre carttidge.

Wait I tossed that cartridge in the drawer because the MAC OS was such
a waste of CPU cycles.!!!! Guess I'll just keep on using a user friendly
pre-emptive multi-tasking system.

Peter,
Does it really upset you so much that some people actually like
their Atari computers? As a former MAC developer the Atari computer is
much easier to develope software on. The tools available are light years
ahead of the tools for the MAC in both quality and ease of use. Since I
like to experiment with code the MAC is not really an option because of
those tools.

If I had my choice of home computers I would own a NeXTCube but my ST and
TT provide the features and power I want/need, particularly with MiNT 1.10
and the Unix utilities compiled for it. Now when the MAC version of MiNT
is as stable as the Atari version I may look it over again. But I'll dust
off my Spectre cartridge and do it that way, not by dropping about $4k
to buy a computer and software to get to the same level of capability I
have with my current Ataris and their tools.

Brian

P.S. As long as we are using Atari Computers they are not dead.

> Grow up and stop being such a sad git.

No, Apple does not make consoles. Apple has been selling over a million
cdroms each year for the past two years. By the ned of 1994, over five million
Mac users will have cdroms attached. That is a big market for cdrom
development such as games. There are lots of cdrom games on the mac and Rebel
Assault will be awesome.

The Jag is a flop, accept it, nothing you can do about it. Live with it.

The argument is to bring new owners in the Atari fold. So far, Atari has
failed miserably to persuade people to buy anything that Atari makes.

Oh, what B.S. So what software were you using? The Falcon was not upto snuff
to run powerful Apps and had to use a Mac. I am using a Duo210 which is
running at 25mhz.030 and is fast when running Z-term and WriteNow. When
running Word which is huge, not as fast as WriteNow. On the Falcon, I suspect
you are use less powerful Apps since that platform lacks the sophistication
found on the Mac. Nice try fella.

I post prices for comparison purposes, something Ataridroids have been doing for
years in the era of high Mac prices. Now that the reverse is true, you get all
indigent.

At least I have options where i can buy hardware. I am thing of getting a Duo Dock at my local dealer or invest in destop one like the new 630 series comming out in July.

I am sure the Medus will be as fast as the 040 Macs. But will the Medusa cost the same, less or more than the new Mac 630 with 8megs ram, 250 meg HD and CDrom drive for $1500? I doubt it.

No. Atari users can do what ever they like. The question is should new users
new to Atari invest in the hardware and software. That was the advocacy
question. Atari advocates got angry because people were not being swayed to
their platform of choice. I am not saying that the ST is not a decent machine
but Atari has made it clear that their time and resources will be spent on the
Jag and not their former computer line.

> If the design of the machine and OS is that BAD, I DON'T WANT IT!

If you are running powerful Mac apps, than you would need a faster Falcon.
Instead of using Word, WriteNow is much faster if speed is important, but not
as powerful. No the hardware and OS is not bad, you lack the powerful apps on
your platform.

Mac Mall has Q605 4/80 FOR $799! Much cheaper than the $1299 Falcon. You can
get a Q660AV mac with 230 meg HD's for $1299.

No, no peter. You don't get it. The Medusa is FASTER than the 040 macs.
My Falcon is faster than the low end 040 macs for general purpose tasks. THe
Medusa has a CPU faster than any 040 mac to begin with (64 mhz clock doubled)
plus, without the overhead of the Mac SludgeOS, it should run most tasks on
a speel level comparable to a powerMac.

Jesus Sinclap, you just don't geddit, do you!?
I was running JUST one app on the MAC (That Labels program - I forget what it is) and it ran (should that be crawled!?) VERY SLOWLY. I wasn't using the Falcon because it is MY MACHINE, it stays at home - I brought it in to work one day, and it took me until 9 at night to get it out the work dudes were so interested in it. As for the Falcon, I was comparing it to Calamus SL, Everest 3.0 and Atari Works running concurrently. I suspect you are a complete idiot Sinclap, as you lack the sophistication that your mac apps have.

One thing good about macs - they have a lot of users or it that they use a lot of users!? ;^>

Now Peter, go find me another MAC to better the above for me, I'm sure you can find another model to do the same.

Man, what a tool. And I thought that he actually had some substance there for a while.

Karl.

Errr...Peter? Would you PLEASE stop talking about Atari software, because you
don't know even the slightest bit about it?

Mac software is sophisticated? Perhaps, but surely Microsoft apps are not,
you were using a Microsoft app (Word) as a pro-Mac argument. Have a look
at Atari WPs like Tempus Word pro, Papyrus GOLD or Script 3.5, THEN complain
if you still feel like it.

Z-term is a terminal program/comms package? Have you ever seen CoNnect?
Surely not.

And the Falcon's raw computing power is meaningless if you are using apps
with much I/O, like WPs and comms packages, don't you even know THAT? Only
the GUI speed counts for this kind of programs, and here the Falcon has a
major advantage, as any Atari.

Ah, so Sinclap is admitting that the 68040 macs gives very bad performance,
unless you are running a certain type of applicaction---so bad infact that
that he has to guess that there is no match on the Falcon---well, that is fine
but the weasel words ``I suspect'' give away his ignorance.

Nice try Pete.

You're obviously new here then :-)

Peter has been pissing people off here for so long that even if he did say
something sensible (which about once a month he does), no one cares. We just
tell him once again to go away.

Of course, there was nothing wrong. But these news were not his. He just
forwarded them from rec.games.video.atari. That's why this time it seemed to
have sense. His only contribution seems to be the title: you can recognize his
inimitable style.

Hey folks, why don't we all (Peter..) agree to follow the basic premise that computers are tools, and as long as a given tool suits your needs, THAT IS ALL THAT MATTERS!

A good example, I know of a multi-million dollar manufacturing corporation that still does all production scheduling on an IBM System/36. For the younger folks out there, the 36 is a mini that has less RAM, storage, and processing power than a 486, and cost about $50-75k 15-20 years ago. Why, despite IBM's attempts to sell them an RS/6000 workstation, or an AS-400 mini, do they continue with that dinosaur? Because it still satisfies their needs! They don't need to do things any faster, or need more storage, because the basic problem that the computer solves for them is still the same!

Yes, I personally upgrade machines & technologies frequently, but that is my vocation and advocation. But I don't beat up people who still use a DOS wordprocessor on an INTEL 8088 machine, or for that matter, folks who still us a CP/M based Kaypro for word processing. As long as the machine suits your needs, and does the job well, the rest is NOT IMPORTANT.

Same applies to video games. Enjoy your games? Satisifed w/the graphics? Color? Sounds? Well, then who the heck cares to get into a debate about which TECHNOLOGY is SUPERIOR? WHO CARES?

Atari Advocate? Great. Next Advocate? Great. All neat machines and OS's that HAVE THEIR VIRTUES! If the users are HAPPY, then let it rest in peace!

Discussion should't be "my dad is bigger than your dad, so you better not push me again," but "my machine is neat because .. and I acknowledge that your machine is neat too.."

Play nice & quit sticking your tongues out!

Mike it works on my ST and TT, but it is rather slow (single speed).

<flame bait for "YOU KNOW WHO"!!!!>
So it fits right in with all MAC products ;)

: >

: -Peter

Mac suffers from the same disease that Microsoft has. Don't cate about the size or speed of the app. If the new version doesn't fit in your RAM, fit on your hard drive, or runs too slow, throw more hardware at it. Well, hardware IS NOT cheap.

Why is it that an Atari app with the same capabilities as a Mac application is so MUCH SMALLER and FASTER? Because, unlike developers for the Mac, Atari developers actually CARE about what they're doing.

Mac is suffering from bloated software just as badly as Windows is. Well, I don't want an OS written my people who can't optimize worth shit, and I don't want software written by even bigger idiots.

I want my fast Atari with my fast, small, powerful software. A Quadra doesn't match the speed of the Falcon030 because the OS developers write big, bad, slow code, and the software developers are even worse.

If my computer has to sit there and constantly access virtual memory because 4 megs isn't enough to run my word processor (partially due to the fact that Mac does not have dynamic memory allocation. Boo on them!), it's GOING TO run slow. Simple as that.

On the other hand, if I have quite a number of AUTO programs and desk accessories on my Falcon, run my wordprocessor, have several large docs open, and have more than 1 meg free out of the 4, then someone did something right.

And here's another question about Apples.... will the PPC Macs ever run fast? They're slower than the Quadra's, and have about 10% of their OS code in native PPC code. All but the bare essentials are emulated, and none of the new software is PPC. It won't catch on for the Mac. Too many people have the old machines, and the developers just aren't going to care. And the Mac developers didn't care to port the whole OS, or even design the hardware well... the hardware interrupt timing signals in the PPC Mac is as bad as in the regular mac.... NON EXISTENT. That's why there's no preemptive multitasking.

>Z-term is a terminal program/comms package? Have you ever seen CoNnect?
>Surely not.

I agree here- I have used Zterm upwards of 30 times on my friend's mac LC II,
and it is rather limiting. I much preferr STalker and CoNnect! WAY more
options, and better ansi emulation (at least, CoNnect)!

As for raw ascii editors- nothing I've seen so far can touch everest 3.x...
It is simply put, wonderful! Atari Works is not the greatest thing out on the
market, but it is also quite well done. It sure made the output of MY
printer look about 200 times better than before!

"the platform lacks the sophistication"???? BWahah puhleeeze.

They CLAIM it's double speed. But it is definitely slower than the NEC-84
I replaced it with. It is faster than my Chinon 431 but I wanted much faster
so I ended up with the NEC-84.

In the UK, System SOlutions sell them with Atari i/f and drivers and those who
have bought one (a lot by all accounts) say they are very happy with it. Does
your driver put it into double speed mode by default?

Since I wrote my own MiNT driver :) It does nothing special to get any
CD-rom into double speed mode. The entire difference that I noticed
may be entirely due positioning times or drive caching in the NEC-84
and not due to actual transfer rate, though running a test program
gave the CD300 an average of 170k/sec vs 250k/sec on the NEC-84.

My test consisted of measuring the time to read two 32k blocks of data
10000 times from the CD drive. So my tests did include head positioning.
I felt this was an accurate way to measure throughput since this simulated
the loading of the 32K cache blocks I was adding to my CD driver. The
tests were performed on an HP-720 workstation, and the two blocks caused
the heads to have to move about half the disc each read.

I should add that under the same test my Chinon 431 rates only 100k/sec
and it is a very old single speed drive. So the CD-300 is about twice as
fast as my Chinon, but close to the single speed spec of 150k/sec. But in
MY tests the NEC-84 performed better. The NEC-84 also cost me slightly less
than the CD300. (your costs may vary)

It should also be noted that for most CD-Rom applications the user will be doing sequential accesses, or at least not have such drastic head movements, so head positioning times would not apply.

I may port this test over to the ST/TT to get a more accurate picture of the CD-Rom speeds on an Atari.

Brian

So how much does this Medus cost? The Quadra 660 AV Mac is not a low end 040.
Does this Medusa cost $1400 like the Q660AV 8/230 does? I think not. The
Medusa is not comaparable to a PowerMac running native apps.

Oh please, I run WriteNow, Z-term and DayMaker concurrently. The Mac Apps are more sophisticated and powerful than your crap.

As I was writing this, I was listening to CNBC on television when my ears perked when the Dorman report
when Dan Dorfman was doing his segment on the Dorfman report. His stock report focused on "Hot air: management hype" on Atari Corp with its management hype on the Jag. Dan Dorfman called the Jag a flop- his words. Ha ha ha hah- what perfect timing.

Well anyways, he trashed Atari and Prez. Tramiel. Prez. Tramiel not to long ago said that Atari would have sales of $200 million in 1994. According to Dorfman Atari will not come even close. Dorfman alaso quoted that Tramiel stated earlier that Atari would sell 500,000 Jags in 1994, But stated that those sales will not even be close.

He said that the Jag is a flop, Atari will have zero earnings in 1994, and may go out of business. He also predicted that the stock will hit zero. Ha ha ha ha ha.

Oh, more lies. In the Mac market, Mac users have a choice of bloated memory
hungry sophisticated software and efficient smaller written software with
enough features to satisfy one.

I use the latter. I run concurrently WriteNow, Zterm, DayMaker and a couple
more apps on a four meg machine. I agree Microsoft WORD IS A MEMORY HOG but is
powerful.

>

You are suffering from mac software envy. The standard mac memory config is eightmegs and that is still cheaper than a four meg Falcon. Mac software is gtting sophisticated and powerful by the day. Were as Atari software development is at a stand still going no where. Multimedia apps are the norm on the Mac and not on the falcon. Mac users have choces interm of software. Mac users as well as Falcon users can use efficient software that takes little memory. Mac users who want powerful apps that require more memory such as multimedia and ray tracing have that option while those apps are not available on the Mac.

An 8 meg/230 meg HD Quadra 660 AV is cheaper than a $1299 Falcon. Add $55 for ramdoubler will increase the Quadra memory to 16 megs will out any slow downs.

One day, you rabid Ataridroids will wake up.

More lies. A powerMac 6100 running native apps is upto ten times the
performance than an040. the PowerMac running the emulator runs as fast as a
25 mhz 030. With the emulator comming out brings the speed upto a 33mhz 040.

There are 100 native apps today, according to developeres, MacWeek and Apple.
That is 100 days after intro. But there is only five games for the Jagflop
after its been out for ninemonths.

ATARI RULEZ!!!

Let's try a little more flame baiting :)

MAC hardware is a pile of guano!
Proof: You can get a noticeable improvement by
running MAC software on an Atari.

MAC software is a pile of guano!
Proof: Mac users have to port Multi-Tos to the
MAC to get pre-emptive multi-tasking.

Conclusion: The Mac is a pile of guano
Proof: See above.

There! That should cause about 10 -> 20 follow-ups by Peter ;)

Brian

2813. Advoiding SINCLAP

Newsgroup: comp.sys.atari.advocacy
Date: 1994-06-28 20:24:09 UTC
From: bjgrier@bnr.ca
Message-ID: <Cs4JCB.6I1@nrtpa038.bnr.ca>
Source record: 16614

Here's a tidbit for people new to internet:

To not read messages from a particular person you just add their
name to your "kill" file.

However Peter is on his third username in the last year so he
will pop up again, causing you to scurry to add yet another name
to your kill file.

In the last six months Peter seems to have spent every day
finding something bad about Atari computers. While I have
writen my own CD-Rom driver (Other available drivers did not
support the Pioneer 601 and 604) and a program to allow Atari
owners to use Compton's New Media CD-Roms.

Now Peter will point out that if Atari computer were viable
systems someone would have done all this for me. But did I not
do it for others? (Ok the $200 in shareware fees in the FIRST
week helps the old motivational factor)

By the way the CD-Rom support for the MAC is pretty dismal
compared to support for Windows. With my program support for
CD-Roms on the Atari is almost up to the level of support for
the MAC. And since I have more CD-Rom support projects in the
works I hope to be able to have Atari CD-Rom support surpase
MAC CD-Rom support soon :)

I know quite a few MAC and Windows users that read the Atari news
groups, shake their heads and ask themselves why we use Atari
computers. But once they have seen my system computers they
understand its ease of use, ease of programming, and even admire
the commradery Atari owners seem to have.

Most think that Peter is (and Gavan was) shall we say quite a
flaming ___-____.

Something struck me that I think should apply to Peter.
Something that William Shatner said on Saturday Night Live.
Some thing along the lines of...

GET A LIFE!!!

CEO file contents:
Hi,

Perhaps this is a stupid question, but what colors do you people use on your desktops ???

I just can't believe someone can really work with that bright white and green standard setup on a standard colour monitor.

I use a light grey border, a pastel blue background and black lettering since I've got my STE... Ah yes and a pastel yellow MKM_II cone-shaped mouse.

I think it's quite nice. What do you use ?

Bye,
Nick.

I used to for quite a while. It's not bad during the day, but at night in a
dark room I had to turn the bright & contrast way down.

>
>I use a light grey border, a pastel blue background and black lettering since
>I've got my STE... Ah yes and a pastel yellow MKM_II cone-shaped mouse.

Yes, That's what I have now too. I also made the window background the red
color with a *real* light checkered pattern so the red is barely visible.

I also use the windows color CPX with Xcontrol to set the colors of all my
window decorations so the active window is quite pleasant.

I still have to turn the bright and contrast way down in a dark room, though.

Virtually all of my work is done on an SM124 mono unit. Once you have worked with one of these high res paper-white mono units, you can never go back :-). I cannot imagine doing DTP, telecommunications, etc. on a color monitor anymore. These are available fairly cheap, and I would put it right after a hard disk in terms of "Things to get to enhance the usefulness of your ST/STE". Just my $0.02.

Oh, pastel green, a bright red, and I tone down the white to a lower value than default. Neodesk is the king, IMHO. I have not worked from the GEM desktop (for any length of time) in years. Neo uses a lot of patterns to give texture and "apparent" colors to the desktop, and IMHO looks a lot nicer in color than the GEM desktop. Another $0.02.

2822. Re: Falcon's Price/Performance sucks!!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-06-30 01:12:33 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <506xhYB.ari2550@delphi.com>
Source record: 16623

Hi all:

I don't want to get on anybody's bad side regarding this "debate", however, here's my two cents...

I WAS a Falcon 4/85 owner until two weeks ago. I had the machine 6 months and used it daily. In fact, some of you here already know me from my university account (FELDAK79). Anyway...

I liked the Falcon but I did feel it was too much money for what I got. Why? Well, the machine was slow in its native graphics modes. I mean, I could literally see the screen redraw panel-by-panel in 256 and TC modes. This performance is analagous to a 386SX-16 running Windoze.

Granted, the Falcon ran most of my ST software very quickly but I could count the number of applications and games that TRULY took advantage of the architecture on my hands and feet (5 digits on each, thank you).

The Falcon hardware is still not cheap, either. I sold my Falcon to a music dealer and picked up a cheap PC clone. For well under $725, I got a custom 386DX-40 w/SVGA card and display, mouse, 4 megs of RAM, and a WD Caviar 212meg Hard Drive. Under DOS, this low-end system simply kills the Falcon in every aspect exect in displaying sprites and playing sound.

Finally, I disliked the Falcon because its software support was weak. I do contract graphics work for computer games and the Falcon simply doesn't have the kind of software I need at the price I want to pay. TruePaint is shit, Prism paint II isn't much better, and DA Paint is too much $$ and too much power for my needs.

Anyway, I think you get my perspective.

Regards,

Ari

P.S. I still have my STe - now that's a machine worth the $$

2823. Re: Atari not quite dead.

Source record: 16624

No, Atari isn't dead but it is on life support. I work for a major financial service and brokerage firm and watched in disgust as Atari's stock dropped approx. 20% of its value while hundreds of thousands of shares were sold. Atari's Chief Financial Officer was quoted on DJ news that Atari has dropped it's support of the computer line and Sam Tramiel himself made an announcment urging people to stop the selling craze. People are losing faith in the company. I know I have...

Atari has less than 5 months to sell those "one million" Jags by Christmas. Will they do it? I don't know anymore...

My advice. Sell your Atari hardware while you can - unless, of course you are happy with it. I was for many years but I've outgrown the architecture.

Ari

2824. BABBAGES is CO-OPTED by Nintendo, SEGA and 3DO

Newsgroup: comp.sys.atari.advocacy

Was in a BABBAGEs (Computer Store like EGGHEAD) the other day in Annapolis Mall (Maryland) and had to look all over the G-damn place (very small store) to find the JAGUAR Stuff. What kind of conspiracy is this !? If ATARI only knew that some stores are HIDING the JAG stuff and the clerks know NOTHING about how great the JAGUAR really is. I WAS OUTRAGED !!!!! They claim "When the carts come out then we will move them out in the open where people can see them" Chicken or the Egg ???!!! While 3DO Sega and Nintendo have big PROMO Stands, Posters and even demo systems to play and watch in the store window, there was nothing at all about the JAGUAR anywhere. They keep the JAGUAR stuff in the back or inconspicuously on a hard to find shelf as if they had no clue JAGUAR TECHNOLOGY has won TECHNICAL EXCELLENCE awards, both National and International, is made entirely in the USA and is AN ALL AROUND KICK ASS SYSTEM only to get better.... But when you ask if they ever tried one the CLERKs look at you glassy eyed with slack jaw and reply, "NO but the 3DO is much better anyway" DUH !!

Please pass it on to all you know at ATARI because some of the commercial/retail software/game outlets out here are not trying in the least to even know what the JAGUAR is all about. Not sure how why they are so ignorant. Could be they need a little more literature or a demo machine to set up... This is where the rubber meets the road and it does ATARI no good to have such DUMB clerks out there HIDING the BEST GAME SYSTEM EVER

game.guru@TeamInfinity.com

2825. Alternate (non PC) computers: no future ?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-06-30 15:14:12 UTC
From: proche@imag.fr
Message-ID: <2uung4$m8p@isis.imag.fr>
Source record: 16626

Hi,

The dark times are coming. Ari Feldman's posting is quite revealing. Despite Sinclap's stupid believings, Atari's worst concurrent computer surely isn't the Mac: it's the PC. I can see the coming of the day when the only 'home' computer still alive is the PC. Here's why.

Let's have a look at the micro-computers' History. In the beginning of the eighties happened what could be called home computing explosion. Computers like Sinclair ZX81 were sold like crazy (in French, comme des petits pains). Estimations were that every home would possess a computer before the end of the decade (are we really here today ?). So lots and lots of companies released their own computer. Everybody wanted to have one to sell. If I remember, there was the choice amongst at least 50 different machines and as many manufacturers. Ten years after, most of these machines had disappeared. Only 4 systems remained: Mac, Pc, Atari and Amiga. Why ? Of course, there were too many computers for a too low market which had been over-estimated. The first two survivors were still alive because of their professional abilities. The last two were still around because games that were produced on the 8-bit machines Atari 800 and C64 slightly overtook games available for that time's consoles. Maybe their architecture was better than their concurrents (remember their famous graphic coprocessors ?). Anyway, this gave Atari and Commodore the opportunities to evolve and to release the ST and the Amiga.

Today, what's happening ? Commodore has sunk. Atari is leaving the computer market. Who's fault ? I don't know what happened to Commodore. I still don't understand. As for Atari, they didn't dare to produce enough Falcons; meanwhile, soft editing companies, except a few ones, didn't dare to produce games for the Falcon, maybe waiting to be sold in larger quantities, or maybe disappointed by soft piracy. Moreover, in the 80's, games were better on computers than on consoles. Today all this has changed. For most 'customers', when you have the choice between a cheap console with beautiful graphics, animations, sound quality, and a computer which can offer the same kind of games with sometimes almost the same quality and the ability to be used for more than games, but at a far higher price, guess which one will be chosen. So, game players who made the success of Atari and Amiga turned to consoles and sealed the doom of Atari and Commodore. Others moved to the PC where they can find different games and still use it as a computer.

Soon you'll have the choice between 50 Mac computers and several types of PC. Then, there will be only PC (sorry about that, Sinclap, but your turn will come). Just when the main purposes of the Mac (mosly text editing) will be surpassed by the PC (wait, isn't it the time NOW ?).

I don't like the PC. I don't like its architecture (no graphic coprocessor, the main processor has to do the whole work). I don't like its processors

(this notion of segment is a plague). I don't like MS-DOS and its 640k limit; as a programmer, this is an even worst plague. From what I know, programming Windows applications is a mental torture. I don't like to develop on a PC. If this comparison has any meaning, developping time on a PC is 10 times higher than on a Sun (OK, not the same price). I like some games on the PC, but each new game requires more and more speed and memory, so you can't really enjoy new games two years after buying your machine. The only good thing I must admit is the speed of Intel processors, wasted most of the time.

I've been an Atari user for several years. I own a simple nearly-ten-years-old ST and I'm still amazed of things that can be done with it (last surprise, Starball which is shareware). Imagine what you could do with a 10-years-old PC ? Play pong ? I plan to buy a Falcon because it seems to be an innovative beast (that DSP was a really great idea), but I don't want a dead-born machine. So what ? Buy a PC ? No way ! Buy a Mac ? To meet users like Sinclap and become like him ? Certainly not ! Moreover, I don't need any text-editing machine. Buy an Amiga ? It's presumed dead.

So here's the fact: you have now the choice between consoles, brand-new dead machines, text editors, and Prehistoric Computer. MERDE !
So when I see Sinclap post those insane prices lists, I really want to say "stop this mess, let's find reasons not to buy a PC".
Sorry about the length, but this had to be said.

Pascal.

|> This performance is analagous to a 386SX-16 running Windoze.
Never ever use a Falcon without NVDI. How many times can it be said? It makes
such a difference. Without NVDI youmight as well give up (err, you did!)

|> Granted, the Falcon ran most of my ST software very quickly but I could count
|> the number of applications and games that TRULY took advantage of the
|> architecture on my hands and feet (5 digits on each, thank you).
Alas, true by andlarge.

|> Finally, I disliked the Falcon because its software support was weak.
|> I do contract graphics work for computer games and the Falcon simply
|> doesn't have the kind of software I need at the price I want to pay.
|> TruePaint is shit, Prism paint II isn't much better, and DA Paint is too
|> much $$ and too much power for my needs.
Jesus, your hard to please. You complain about programs that aren't up to it and
then complain others are too much. As a graphics professional you should
recognise the need to buy the best tools to do the job. It's the same with
programming. It might look expensive but it pays for itself in productivity in
no time at all. if your time is worth say 20$ an hour and you buy a 300$
application that lets you work twice as fast, it will only take 3 days or so to
pay for it!

|> Anyway, I think you get my perspective.
Indeed.

|> P.S. I still have my STe - now that's a machine worth the $$
No argument there!

GeneralI agree with your sentiments. However, its not so much as a matter of sales personnel ignorance as it is money - Sega and Nintendo spend a great deal of money promoting their products and people buy them. They also pay retailers premiums to stock their stuff and put it out in open view.

When Atari's stock was up to $11/per share and the Jag looked like it would take off, many local retailers in my area had the Jag out in the open... funny how things work, eh?

Yes you are right - but I'm no musician so I don't need Midi apps and
I don't do (or plan) to do Windoze...

I wordprocess, play games, and do game graphics - all are applications well
suited for my *inexpensive* 386 clone.

The Falcon is well suited for all of the above apps I mentioned, however,
it is lacking in the games and graphics program support.

BTW, I still have my STe w/HD...I only sold the money pit machine (Falcon).

Yes, I am hard to please! However, I'm still in college and like the rest of
you I too must struggle to make ends meet. Therefore, I spend my hard earned
money on the products that I deem most useful and the least expensive.

I only wish I got $20/hr for my time! I do game art/animation - programs like
DA Paint are made for photo-retouching, etc and not for sprite animation and
background graphics. However, programs like Deluxe Paint II PC and
shareware programs lie Improcess are.

When I have the $$$ I will "expand my toolset" and move up to a "fast" PC and
better tools.

I sense a certain air of desperation in the referenced post. The 68XXX mac and the intel based pc are both becoming dinosaurs. RISC technology (be it powerpc or the intel/hp thing) will supplant them both. Compatibility will be the key. IBM/apple/motorola seem to have vision of producing a common box which will run the user's choice of operating systems and applications. As a USER, this is what I want. I really don't care about what's in the box, I care about what I can do with it. As much as we respect our Ataris, the corporation has no vision, and without vision the culture will slowly die.

Have you noticed the excitement in the mac world lately? A new architecture, compatibility the past, forward looking vision combined with corporate might; all the things that atari could have (should have) done. Sigh.

I just finished reading this week's InfoWorld and it had some interesting points about the PowerPCs and the members of the coalition: IBM, Apple, Motorola.

"Apple's PowerPC-based Macintoshes, however, do not conform to the [standard]. 'The problem with the [standard] is that it is set in sand.' With Apple, IBM PC Co and the RS/6000 group all going their own ways, the question arises: Which is the real PowerPC?

"There is tremendous confusion in the market. If IBM, Apple, and Motorola don't get united, they will miss the opportunity."

I believe that PowerPC is a bit overblown. One architecture? Maybe. One OS? *NO!* You have OS/2 competing with AIX, Solaris, WindowsNT and either NetWare or UnixWare from Novell. This is in addition to the MacOS, which Apple has not decided to license. Where's the advantage ? Microsoft must be laughing it up right now: All the hardware people are competing with one another, Lotus lost half its stock value, Novell doesn't know how to compete with PC apps (WP and Quattro Pro) and they are going to clean up. Everyone realizes that all future hardware must be "Microsoft compatible." Once WindowsNT gets going in its second or third release, watch out. Atari's problems are going to be seen as miniscule compared to a market dominated by one company.

Basically, the hardware is becoming a commodity. *IF* Atari can license its technology to other companies for ST Clones, *AND* they figure a way to run WindowsNT, *MAYBE* they have a chance. But, frankly, I doubt it.

BTW, I am the proud owner of a 1040ST that I use for programming. But, as said elsewhere, "my ST fulfills my needs, only because my needs haven't changed."

Yeah, let's just wait for a few versions later of Windows NT. Hmmm... well, let's see... you'll need 64 megs or RAM, 100 megs of HD space, and a 620 PPC running at 500mhz as a bare minimum JUST TO RUN THE OPERATING SYSTEM. You'll need another 64 megs or RAM so that you can run software (one application only will fit), another 1 gig of HD space to store your apps and other useless garbage, and ANOTHER 620 to run your app (only one at a time to get any speed), because the other one is overloaded by the OS.

yes, people, this is where we're heading with Microshit. BIG, SLOW, HORRIBLY WRITTEN software that also costs every dime you have.

Do you really want that? Microschmuck and their bloated (the size of Jupiter) OS and software?

When Microsoft rules software, the world has come to an end, because we won't be able to run anything. Only Bill Gates has enough money to may for the hardware required to run his company's crap.

I'd like to talk to Bill Gates some time and ask him WHY he's such a tyrant in the business, concerned for nothing but his wallet, while his multi-billion-dollar corporation churns our the worst software in history that you can't run on any reasonable amount of hardware and brainwashes the public into buying it with pure media-hype.

All Microsoft and Intel are is media-hype.

Oh, and now let's talk about Intel. They're not tyrants. They're just stupid. Their processors, until the 386, were so inefficient that a Motorola processor running at the same clock rate would run software on the order of 3 to 6 times faster (not counting anything like the fact that 68000 programmers knew how to code while Intel programmers never cared... we're talkling about raw computing power). When the 386 came out, it was almost up to the efficiency of the 68010... they had to bump up the clock rate to rediculous speeds (and create a lot of heat) to get decent speed. Next was the 486... they increased the efficiency a little, but didn't really do much but make the chip run hotter.

And then there's the Pentium, the worst processor in history. It's based on the old 8088 design (just like all it's predecessors), which gives it a horriblly designed and kludged up instruction set, a half-way decent memory management system (that no one has yet to use right), and a new SuperScaler mode that no one is ever going to use and just serves to make the chip hotter. I touched a 486sx-25 once and regretted it very much. Just amagine the pizzas you could cook on a Pentium.

But there's the media hype that's got people believing that the "Intel Inside" warning label is actually a good thing. It's kinda like Coke and Pepsi marketing.... it's the thing to have, except they both taste like malted

battery acid. So, now we're marketing bad CPU's just like soft drinks... and laxitives and tampons and shampoo and diapers. Yes, you MUST buy Pepsi... why? Well, just BECAUSE! Everyone drinks Pepsi. Well, so, therefore, must everyone have a Pentium... to cook dinner on.

Shampoo... and toothpaste. Now, THOSE are the things to market. Not everyone's going to buy a new TV or new computer or new car every day, but they're going to be USING UP their shampoo and tooth paste. If you want money, sell something that people are going to need more of.

Now Microsoft and Intel are trying to sell computer stuff (and BAD computer stuff, might I add) like tooth paste. You're going to use it up, it's going to be outdated in a week, and you have to buy another to keep up with the demands of the software.

Well, toothpaste is a whole hell of a lot less expensive than a new computer. I want my software to fit my computer, not the other way around.

I'm sticking with my Atari, where the software fits the machine and does a damn good job of what it does, and I don't have to buy a new computer just to use the "wonderful" new features that Microcrap pretended to add to the new version of their software.

: must admit is the speed of Intel processors, wasted most of the time.

What gives here? Let me cover some points with you:

* I have a graphics coprocessor, an S3 accelerator,

* The problem with segments under the 80x6 was that they were too small.
Most multitasking/timesharing/multiuser computer systems in the world
all use segmented architecture because it is an incredibly powerful
way to manage memory, as long as the segments are very large. Most
systems without segmented memory have it simulated by the OS (like
UNIX on a motorolla) Segmented architecture is a fine solution to
memory and process management. Keep in mind that a 486 in native mode
uses segments... it's just that each one is 4 gigabytes, not 64k

* I don't run MS-DOS... this machine has never had it loaded except
under an emulator or to play games (I run UNIX BTW)

: By a PC ? No way !

Why not? You don't have to run DOS on it.

: Buy a Mac ?

Dead machine too, eventually. Apple is rapidly moving away from it
and to bigger and better (?????) things.

: Prehistoric Computer. MERDE !

Inaccurate... but funny. As soon as the ISA bus is gone, complaints
about the "PC" will be moot because that is it's last stumbling block
(and not hear as bad a one as is advertised). PCI and the ability
to get Intel, MIPS, whatever processors on the open market is going to
make the PC the ultimate winner.

: "stop this mess, let's find reasons not to buy a PC".

No. Look at where it's going and realize that it's the only logical
choice... 'cept maybe a workstation and once we get rid of ISA... what
is the difference between a PC and a workstation? Not much...

Source record: 16492

Gleaned from the 6th page of Atari's 1993 annual report, 3rd paragraph:

---------- <-% cut here----------
Atari Falcon030 Series of Personal Computers

The Company offers a Falcon030 series of personal computers based on the 32-bit Motorola 68030 microprocessor and which include a Motorola 56001 Digital Signal Processor. The Company designed four custom semiconductor chips for the Atari Falcon030. The Ajax chip is used as the floppy disc controller. The Combel chip functions as the memory controller and graphics processor. The high quality video is performed by the Videl chip and the direct memory access is handled by the SDMA chip. These computers are capable of recording and playback of sound in 16-bit stereo at 50 MHz which is above CD quality specifications. The Atari Falcon303 computers operate at an internal clock speed of 16 million cycles per second. The computer can display high quality video in 16-bit true color displaying 65,536 on-screen colors in a resolution of 768x480. For video, the Atari Falcon030 can use standard VGA and Super VGA monitors, televisions, and Atari color and monochrome monitors thereby giving the user greater video flexibility. The Atari Falcon030 can be configured with different RAM (random access memory) sizes of 1 meg, 4 meg, and 14 meg and various hard disk drive sizes. The Atari Falcon030 uses an enhanced version of the Company's TOS operating system which includes multitasking (MultiTOS) and is compatible with most of the application software developed for the Company's ST series of computers. The Atari Falcon030, through its array of interfaces, can link to audio visual equipment such as televisions, monitors, hi-fi stereo systems, musical synthesizers, modems, telephones, printers, and digital audio tape (DAT) players. The Company has a license from Kodak so that the Atari Falcon030 can play back, manipulate, and edit Photo-CD (a PhotoCD player is needed). This combination of features positions the Atari Falcon030 well for the personal multimedia market. Since introduction in the first quarter of 1993, the Company has shipped small quantities of this product. The Company does not expect sales of this product to be material in the future.
---------- <-% cut here----------

I draw your attention to the last two sentences of this section. Further, on the same page, 4th paragraph:

---------- <-% cut here----------
Other Products

The Company also has some inventory of its older 16-bit computer products and 8-bit game products, namely ST and TT series of computers, 2600 and 7800 video games systems and XE computer and Portfolio products. As a result of these inventories being technologically obsolete and noncompetitive, the Company has written off these inventories. The Company is expecting minimal sales from these products in the future.
--------------- <-% cut here---------------------------

Again, rather interesting, as all of this comes, as it were, from the horse's mouth.

-Ben Keen

Mine looks like this:

g:\usr>

I keep GEM hidden in programs behind the old Mupfel 1.21, or behind bash
1.1.35 when running MiNT.

Well, that's one way to do it. I happen to like GEM. I still remember the PC Guru who came over (he'd never seen GEM) and when I turned on my Falcon to do something, the first thing he said as I was using it was "I like this GUI a lot." He liked the way it looked and the way it worked. :)

~Chris

p.s. it was standard Falcon TOS 4.02 at 800 x 600

: it does ATARI no good to have such DUMB clerks out there HIDING the BEST
: GAME SYSTEM EVER

: game.guru@TeamInfinity.com

: (ATARI DEVELOPER, ADVOCATE, SHAREHOLDER)
As a FORMER employee of Babbage's I can tell you that the simple
truth is you cannot get people too inspired about game systems paying what
they pay. (I left over a wage dispute) Secondly the simple fact is that
floor space is limited at those stores and you cannot bump Sega or
Nintendo, huge sellers, to display a system that has, of this writing, 5 or 6
games out! The fact of the matter is that a system will not sell if there
is no software support for it. This is why the TG-16 floundered and faded
away. As a Jaguar owner and stockholder myself I am very distraught at the
trickle of software that has arrived. I've read many press releases about
all the developers for the Jag but the better get in gear or they will be
left in the dust. Finally not all Babbage's have the Jag hidden. At the
Babbage's in Fairlane Towne Center, Dearborn MI, they have it displayed on a
wall at the front of the store next to the 3DO. They have also never
failed to answer a question I have about release dates. So I believe that
you found a crop of morons not a conspiracy by the company.

| |___ | _ | _| |_ | |\ \| | | JAGUAR WRITING CAMPAIGN
|_____| |_| |_| |_____| |_| \___| |_________________________________
```

-=-=-=-=-=-=-=-=-=-=-=-=-=-=- July, 1994 -=-=-=-=-=-=-=-=-=-=-=-=-=-

+++ Please distribute to BBSs, computer systems, user groups, etc. +++

The Atari Community is made up of individuals that are enthused about Atari products more than anyone is enthused about anything! In order to see this enthusiasm, all you would have to do is read an Atari discussion related bulletin board or Atari publication. Some members of the Atari Community have even been a part of the community for 10+ years! Now that is brand loyalty! And that is pretty amazing!

There is just one thing that surprises me about the Atari Community. If there is a software title that everyone would like to see for their computer or video game system, they will talk with each other about how they would like to see it for their Atari system, but they don't do anything about it. They seem to think that if they make a comment on a bulletin board about how a certain game is coming out for another system but not for Atari's system, someone will see this message from the company and then start writing the game for Atari's system. Hahaha. That won't happen.

The only way to get something you want for your system is to let the company know that you want it. A lot of people assume that companies know what is in demand and how much it is in demand. I have a degree in Business (Management & Marketing) and I know that this is not true. Most companies do not know how much a product is in demand. A lot of companies rely on consumers to inform them.

There is no secret that the Jaguar's success (and Atari Corp.'s future) rides on the games being released for it. And even though some of the games being released for it are impressive, I don't think they are enough. I'm getting the same feeling I had with the Lynx, some great games for it, but lack of big name companies supporting it and big name titles being released for it. But I feel partly responsible for the Lynx's shortcomings. This is because I never wrote third-party game companies telling them that I wanted to see them make games for the Lynx. I never told them that if they make a specific game for the Lynx, I would buy the game. Yes, I am

guilty. I just sat there and hoped. How about you?

If you want to see big name companies and big name titles for the Jaguar, join in with this letter writing campaign. I'm participating in this campaign for three reasons: 1) I really think that my letter will make a difference in the decision making process at these companies. 2) I don't want to think "what if" in the future. I want to do my part now so I can say that I did my share. 3) It is my duty as a consumer to let companies know so I can satisfy my needs (or wants).

I hope you will see a need to participate in this campaign as well. And just don't say to yourself that you will write these companies, make sure you write these companies. Make it a priority in your already busy life. Print this out and write the companies.

Thank you.

Sincerely,

Len Stys

aa399@cleveland.freenet.edu
Cleveland Free-Net Atari SIG Manager
CAIN Newsletter Assistant Editor
A.C.T. NOW Organizer

There are FOUR letters to write. Its important!

1ST LETTER

As of July 1, 1994, Mortal Kombat II is not being produced for the Jaguar. And Acclaim has no plans to produce Mortal Kombat for the Jaguar. But next year, Williams will be able to release Mortal Kombat II for any game system that the company wishes to release it for. The time is now to let Williams know that we want to see Mortal Kombat II for the Jaguar.

Mortal Kombat II is by far the #1 wanted game for the Jaguar according to the Most Wanted Games for the Jaguar list by CAIN Newsletter. If this game is released for the Jaguar, the name "Atari" will once again be a household name.

The letter to Williams should include:

Dear Sir or Madam,

1) How much you enjoy Mortal Kombat II at the arcades.
3) How you like the games that Williams makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get the game for the Jaguar as soon as it is released.
6) A thank you to the person reading your letter and for considering

making Mortal Kombat II for the Jaguar.

The address of Williams is the following:

Williams/Bally/Midway
Attn: Console Software Development
3401 North California Ave.
Chicago, IL 60618-5889

2ND LETTER

Electronic Arts is the publisher of some incredible games such as:
NBA Showdown, FIFA International Soccer, PGA European Tour Golf,
NHL Hockey '94, Wing Commander, Super Wing Commander, John Madden NFL
Football, Escape from Monster Manner, Twisted, Mario Andretti Racing,
MLBPA Baseball, and many more! Electronic Arts also owns several other
software companies that they may give the OK to develop the Jaguar for if
they see there is a demand for Jaguar games.

Unfortunately, Electronic Arts is also a major backer of 3DO, a company
that is a big competitor of Atari Corp.. Electronic Arts is spending a lot
of time and money on making games for 3DO that it could be spending on
the Jaguar.

There is hope though! Electronic Arts is a licensee. This means that the
company has Jaguar developers units. Electronic Arts' management just has
to give the OK to make games for the Jaguar.

The letter to Electronic Arts should include:

Dear Sir or Madam,

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your 8-bit Atari
since the company was started (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
5) The games that you would love to see on the Jaguar (choose two or
three Electronic Arts games).
6) How you believe Electronics Arts' games will be unbelievable when
using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games if they produce
them for the Jaguar.
8) A thank you to the person reading your letter and a thank you for
considering producing games for the Jaguar.

The address of Electronic Arts is:

Electronic Arts, Inc.
Attn: Production Teams
P.O. Box 7578
San Mateo, CA 94403-7578

3RD LETTER

Capcom is known for producing the Street Fighter II series of games. The company is also known for producing games such as The Great Circus Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday Night Slam Masters. The company also does conversions of popular titles such as Wizardry V and Eye of the Beholder.

Super Street Fighter II is second only to Mortal Kombat II on the most wanted games for the Jaguar CAIN Newsletter listing. If the game existed for the Jaguar, it would no doubt sell a lot of Jaguars. But Capcom is not making Super Street Fighter for the Jaguar and no plans have been announced to do so in the near future.

The letter to Capcom should include:

Dear Mr. Tresidder,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II for the Jaguar as soon it is released.
6) A thank you to the person for reading your letter and for considering making Super Street Fighter II for the Jaguar.

The address of Capcom is:

Capcom USA Inc.
Attn: Mr. Corey Tresidder
475 Oakmead Parkway
Sunnyvale, CA 94086

4TH LETTER

Atari Corp. recently announced an agreement which will use Phylon's voice-data modem technology into a Jaguar Voice/Data Communicator. This Jaguar modem will allow Jaguar game players to play against or with friends that might be miles away. And it will also allow game players to talk with their friends while playing with them.

There are a few announced games that will use the Jaguar Voice/Data Communicator such as Club Drive and DOOM. But there is really no reason why ALL Atari multi-player games cannot use the Jaguar modem. Checkered Flag, Kasumi Ninja, Spacewar, Star Raiders 2000, and all future Jaguar games that are at least two player should allow for Jaguar modem play. Atari Corp. should also be doing everything it can to interest third-party software companies into making use of the Jaguar modem.

Modem games and networking games is the next generation of video gaming. Virtual Reality is still a few years away, but modem and networking games

are here and now.

The main goal of this letter should be to convince Atari Corp. that the company should take steps to make all future games so that they utilize the Jaguar's Voice/Data Communicator.

The letter to Atari Corp. should include:

Dear Mrs. LaBrec,

1) How much you enjoy the Atari Jaguar.
2) How much you enjoy modem games.
3) How you believe that modem games/networking games will be an important part of the video gaming future.
4) How you would like to see ALL Jaguar games make use of the Jaguar Voice/Data Communicator or Jaguar modem.
5) How you believe that Atari Corp. should be working closely with third-party game companies to make sure that they make use of the Jaguar modem in their games.
6) How you will be more willing to buy Jaguar games that make use of Jaguar modem/networking.
7) A thank you to the person for reading your letter and for considering your suggestions.

The address of Atari Corp is:

Atari Corp.
Attn: Sandy LaBrec
1196 Borregas Avenue
Sunnyvale, CA 94089

It is imperative that you write all of these companies. Even if you do not care for fighting games, you are still encouraged to write Williams and Capcom because these companies will help get other games for the Jaguar.

And lastly, please spread this information text-file around! Give it to your friends and have them write too! In order for this campaign to be effective, hundreds if not thousands of letters will need to be sent to each of these companies. It is possible for this to happen!!! You will just need to help get the word out about this writing campaign.

THANK YOU!

You don't get it, do you? On the Mac platform, we have the best of both worlds on the software side. You have choices of software with all the bells and wistles and ones with out. Software such as WriteNow and Zterm(shareware) have enough features to satisfy many users who don't need the bells and whistles of Word and Microphone prof.(there is a light version). As a result these programs load faster than their big brothers and require less memory and storage space.

Tell me Peter, which Atari Wordprocessors, databases, Spreadsheets, DTP packages and Art/graphics software do you have first hand experience of? You wouldn't make such glib statements if you actually had. If you've only seen 1st Word Plus then I'd agree with you. Having used a variety of heavyweight PC, Unix and Mac WPs and spreadsheets, I know what the state of the art is. There are Atari WPs that get very close to this, closer than you realise and certainly good enough for everyone short of a mega-power user. We *do* have WPs with built in programming languages, we do have fully relational DBs with form designers, we do have full featured spreadsheets. We also have some damn fine art/drawing packages that WILL match your Macs best. Believe it or not. New stuff is coming out as well. I have just heard about another Truecolor package coming from Germany that sounds pretty damned good.

We too have that option. We can get most stuff in PD that's good enough for day to day use. Apart from being a programmer/analyst, I also write for a magazine so I appreciate the importance of a full featured WP - and I have it on my Falcon.

<Yawn>
Carefully only responding to half the statement and then attacking Atari eh!.
My original statment about MAC support was:

|> > By the way the CD-Rom support for the MAC is pretty dismal
!> > compared to support for Windows.

At least you chose not to try and refute my statement.

btw: I go to Babbages, Electronics Boutique and Walden Software and I
don't see ANY MAC specific cd-Roms. Egg-head has about a dozen MAC
CD-Roms. So you have to go to a store that sells liquidated stock to
get a good selection of MAC cd-rom titles. This should tell you something.
I can get Compton's MOST titles at all the stores I mentioned, heck
I can even get them at Sears, and use them on my Atari.

|>
|> My brother has a collection of tens of cdroms...

Gee I have twenty-six I use with my Atari on a regular basis.

|> > Something struck me that I think should apply to Peter.
|> > Something that William Shatner said on Saturday Night Live.

Around here, the Jaguar gets more shelf space than it deserves. There are lots of small stores that display it, the Good Guys displays it, etc. (The Good Guys did take down the set up Jaguar that you can actually play, but . . . .)

I own a Jaguar, and I think it has potential. But the simple fact is that there needs to be at least 12 games. There are only 4 that you can buy. (Trevor, Tempest, Raiden, and Dino Dudes. Cybermorph is free).

None of the games are good enough to make people buy the thing. None of them compare to the games for the 3D0. (Which is going to die, but more because of pricing).

If you look at the games, you can see what the Jag. is capable of, but none of the games harness the power well, and none of them have mass consumer appeal.

Aliens v. Predator is the only hope I see. And it is MONTHS late.

And in reality, it is true 3rd party software that is required to make the Jag a success, and since the initial list of developers, I have not seen a single product or even indication that anyone other than Atari is working on games. (And the people Atari contract).

Hopefully Atari gets its act together soon and delivers good games and gives developers some incentive. (Hell, use some of that 30 million in cash to pay the developers. If there are not games soon, the Jag will die).

Even the media has forgotten/written off the Jag. It is not even mentioned anymore, and the Sega and Nintendo 32 and 64 bit systems are viewed as the only high tech game machines. (And they are not due out till next year!)

> uses segments... it's just that each one is 4 gigabytes, not 64k

What do you mean by native mode? The 486 boots
in real mode, which uses 64K segments and has a limit of 1 MB of memory.
The 32bit protected mode (which might be what you mean), allows segments up to
4 gig, but "each one is 4 gigabytes, not 64k" is incorrect. Each one is
the size allocated to it, up to 4 gig.

In either case, segmentation is a joke. All the same memory protection can
be done in the paging system. (Paging, by the way, is far more common than
segmentation. Most unices use paging. Very Very Very Very few use
segmentation, which is largely an Intel invention. All use memory protection,
which provides seperate address spaces for programs. Perhaps that is what you
mean?)

>* I don't run MS-DOS... this machine has never had it loaded except
> under an emulator or to play games (I run UNIX BTW)

Congratulations. Personally I run DOS on my PC, as I need it to access
98% of my software. (Dos and windows).

But, Linux is a nice unix port, and is free. You would be better with a
real workstation, which wouldn't suffer the performance penalties of a
PC, but then again you would need to spend a lot more money. . . .

>: By a PC ? No way !
>
>Why not? You don't have to run DOS on it.

But DOS is the mainstay of the PC market. OS2 is rare. Unix is 10 times
as rare. If you do want to run unix, and do not need super speed, it is a
cost effective way to do it.

>: Buy a Mac ?
>
>Dead machine too, eventually. Apple is rapidly moving away from it

ISA is the **LAST** stumbling blocks? One of hundreds. PCI is a move in the right direction, but is not catching on very quickly. (I.e. ISA is going to be bigger for at least 2 more years, possibly more).

MIPS PCs (and nay non Intel PC) are still not too viable. Maybe in the future.

2852. Atari / Death / Music

Newsgroup: comp.sys.atari.advocacy
Date: 1994-07-05 21:02:31 UTC
From: philipj@cogs.susx.ac.uk
Message-ID: <2vchp7$asi@infa.central.susx.ac.uk>
Source record: 16503

Lots of people seem to be worrying about the future of Atari recently. I sympathise - I've been an Atari user for about five years and hate to see the company go down. Nevertheless, I think that Gates has pretty much got the general purpose computer / operating systems market sewn up. (I am extremely sceptical about the other companies. Apple / IBM / Unix flavours / Novell are going to tear each other to pieces, fighting over who is to be number two. Watch out for some serious shafting among these players within the next five years.)

The way to survive now, is probably to specialize into providing readily boxed applications (hardware and software) to consumers. That's the lesson from Nintendo and Sega and CD-I / 3DO / surf-the-net-from-your-telly-corp. The question is whether Atari can get into the game. The Jaguar is a fair attempt, which by all accounts - I don't think it's over here yet - is technically very good (just like Betamax) but suffers from a software shortage (ditto). It's also late into a fairly mature market.

But dedicated games machines aren't the only way of repackaging existing technology. Atari still has a very good brand name amongst musicians, plenty of whom use STs to control their studios. What I'd like to see is Atari repackaging the ST's technology and TOS in a box that was aimed at this market. Such a product should

be in a single unit (built in hi-res LCD, trackball, QWERTY Keyboard but maybe smaller than typists need.)

be in a portable, rugged, spilt-beer-proof case (not-clamshell) suitable for gigging with.

cheap (300 pounds sterling) to compete with dedicated hardware sequencers.

have a commercially standard sequencer (like Cubase or Creator) in ROM (or as a plug in cartridge)

in all other ways be a *standard* ST, ie. no TOS incompatabilities. Users should be able to run their fave software directly, and Atari should help existing music software companies to put their stuff onto cartridge.

This shouldn't be very expensive in terms of R&D as the ST / TOS already exists. Atari could also exploit it in other ways, perhaps by making the ST available as a sub-assembly to be built into music workstations, professional mixing desks etc.

Atari could also canibalise some of their other technology (currently in the Jaguar and Falcon.) What about using some of the custom graphics chips in a video titling unit? (Perhaps with Colourspace or Minter's latest epic built in.) Or use the Falcon and DSP stuff in a dedicated hard-disc based recorder?

Microsoft, who are a very forward looking company, have already contemplated something similar. They're trying to turn office equipment into Windows machines. The age of the single, general purpose computer, has already ended.

It's scraping the bottom of the barrel to attack the Mac due to
'lack of CD ROM support' and then try to justify it by saying
'compared to Windows'! The Mac is very well supported on CDROM,
not as well as the PC but a lot better than the Atari or Amiga.
This is due mainly to the fact that a lot of high end Macs now come
with CDROM as standard. Is there even one official CDROM drive for
the Falcon? At least the Amiga has the CD32 and a drive 'on the way'.
Not to mention a number of 3rd party drives ready for release
which are targetted specifically at the Amiga/CD32 market.

> |>
> |> My brother has a collection of tens of cdroms...

> Gee I have twenty-six I use with my Atari on a regular basis.

And how many of them are Atari-specific? Most will be generic
databases etc, nothing wrong with that, but theres virtually
NOTHING on CDROM that takes advantage of the medium for the
Falcon. Theres plenty on the Mac and an increasing number for
the Amiga.

There is an official CDROM for the Falcon as much as there is for the PC. i.e.
any SCSI one will do fine. Just because Atari does not make their own does
not mean that CD ROM ability is non-existant. Does IBM or Compaq make a CD Rom?
I didn't think so.

Wow. I bought a pack of 10 CD Roms for the PC, and the only really useful ones
are the generic database ones. GO figure.

p.s. Welcom back, Gavan... haven't seen you around much. ;)

There are several (OK, not many) CDROMs that are Atari specific. Apart from that, as you state, we can make use of clip art, fonts, gifs, data files, text files, source code etc etc that are available.
As for a CDROM drive that's official, what's the point? The Falcon has SCSI so why should Atari bother developing a drive when there are so many on the market already? Just plug in and go.

But the original point was about CDROM support on the various platforms,
specifically Mac and Falcon. CDROM support implies software shipped
on CDROM for a specific platform. There isnt a lot of specific Falcon
software.

eg. Mac users can get lots of different multimedia 'encyclopaedias' on CD.
The emerging range of multimedia CD software just isnt available for the
Falcon.

On the PC , Mac and to a certain extent, Amiga, you have a wide range of
CD ROM products - games, multimedia, applications (where there are a lot
of support files). How does the Falcon have 'better support' here?

> As for a CDROM drive that's official, what's the point? The Falcon has SCSI so
> why should Atari bother developing a drive when there are so many on the market

>
> --

The point is that SOMEONE has to kickstart the market for CDROMs on a
platform as small as the Falcon. Atari needs to have at least an
official add-on drive, and specifically needs to have a Falcon
package with bundled drive and software.

The Amiga has had SCSI (and therefore CDROM) for years, but it
wasnt until the CDTV and CD32 came out (along with the computer
add-ons) that we started to see disks for the Amiga.

The Falcon could make an excellent CDROM multimedia player
(a bit too pricey though) but without Atari pushing CDROM
support its not going to happen.

Apple DID push CDROM on the Macintosh and its paying off with
lots of CDROM packages for the Mac.

The post I replied to implied there were no CDROM titles that were Atari specific. I just corrected that honestly. I didn't claim we had better or more, I just stated the facts.

|> eg. Mac users can get lots of different multimedia 'encyclopaedias' on CD.
|> The emerging range of multimedia CD software just isnt available for the
|> Falcon.
I know. I have a multimedia PC with loads of disks like Cinemania, Encarta etc. It's nice. It's also depressing as I haven't seen anything yet on an MPC that the Falcon couldn't do. I doubt I will ever see a falcon specific multimedia title though.

|> The point is that SOMEONE has to kickstart the market for CDROMs on a
|> platform as small as the Falcon. Atari needs to have at least an
|> official add-on drive, and specifically needs to have a Falcon
|> package with bundled drive and software.
I understand what you are saying about kickstarting the market. Let's be honest here though, Until CD32, the Amiga CDROM market was somewhat less than good. Now it's picking up. Atari aren't interested in pushing the Falcon anymore so there is no way they are going to do anything.

In the UK, a firm called System Solutions is selling as many CDROM drives (apple ones!) as they can get their hands on, to Atari users.

As an Atari user, I think the CDROM outlook for us is fine. I would only get a CDROM drive to access clip art/fonts/source code and the like and I suspect many others are the same. MM databases/encyclopedias etc are nice to have but not really essential IMHO.

|> The Amiga has had SCSI (and therefore CDROM) for years, but it
|> wasnt until the CDTV and CD32 came out (along with the computer

Agreed.

|> The Falcon could make an excellent CDROM multimedia player
|> (a bit too pricey though) but without Atari pushing CDROM
|> support its not going to happen.
Almost certainly true. Unfortunately.

|> Apple DID push CDROM on the Macintosh and its paying off with
|> lots of CDROM packages for the Mac.

Apple are big enough to push a loss making product for years without seeing the payback which is exactly what they did with CDROM. Let's face it, Atari are a piss-small company with a few hundred staff and not a lot of cash. If I was a Tramial (God forbid), I wouldn't go near CDROM, not if I wanted my shareholders to let me live. it's just not economically viable.

Atari have always had the view, and I support them in this, that they make the computers. Period. They do not make add-ons, software, speed-ups, bolt ons or any such thing as 3rd parties will nearly always come along and do it better, cheaper and quicker.

OK, I agree with you about advantages of segmentation for memory management and protection. It's just that programming with 64k segments and with those memory models (particularly if you're developping for Windows) is a reel mess. Maybe this can be avoided if you developp applications in protected mode ? Otherwise, I guess this will remain until MS-DOS is dead.

The only logical choice ? This means no choice at all ! This is exactly what I wanted to show. Lack of choice is the worst thing that can happen. See what has happened with Microschmol's OS leadership. The same can happen with hardware.

It's a pity to see people who planned to buy a Falcon changing their mind to get a PC, whose the only attractive thing is not its technical abilities, but its software catalog based on such an old-fashion system as MS-DOS.
Are there still people believing in the Falcon ?

Actually, this is Atari ADVOCACY where you are supposed to defend
your Ataris and advocate their use. A bit difficult to do if the group
is filled with nothing but dedicated Atari owners. Thats probably why
its been so dead of late.

If you think only Atari owners should use it, then thats fine by
me as I own an Atari 800XL/400 and Lynx as well as my Amiga.

Gavan

I'll assume your posting re my msg, seeing as you didn't quote...
The WP with built inlanguage is That's write. The Relational DB is Superbase
Pro and the Spreadsheets, well, you have a choice, K-Spread4, LDW Power and a
3d one. The first 2 read/write Lotus 123 files. LDW is OK up to 123 v2 which
covers most stuff you're likely to want. All work on the Falcon fine.

|> I want to get them.
Hisoft do Superbase Pro and K-SPread4. LDW is a bit in the air at the moment.
You can get in the UK very cheaply from Silica Shop, ditto Ataris presntation
graphics program (name??!!??). Compo are responsible for That's write.

While I agree that certain people seem to post here purely to bait and irritate Atari users, let's not forget that this is an advocacy group. The group is open to all, flame-baiters or not, to post the pros and cons of all things Atari. There are other Atari groups dedicated to the exchange of information/tips which, thankfully, have a very low flame content. Let's keep it that way.

If someone wants to come here and declaim something about Apple, Amiga etc then let them. As Atari advocates, we're duty and honour bound to show them the "light" :-)

Appart from the personal attacks on some people (ie. flames), the posts here, at least to me, seem to be right on target for an advocacy group. In fact, I wonder if this group would die without the constant baiting by a few individuals. Makes me cringe: sinclap keeps atari.advocacy alive!

I usually DO smile at most of the posts here. I used to have certain regular posters in my killfile, but found I missed most of the fun ;-)

>(Hope my english is understandable).

Pretty well perfect! Darn site better than my German.

Cheers, Steve

2866. Re: Atari / Death / Music

Newsgroup: comp.sys.atari.advocacy

Philip Jones (philipj@cogs.susx.ac.uk) wrote:

[deleted stuff]

: But dedicated games machines aren't the only way of repackaging existing
: technology. Atari still has a very good brand name amongst musicians, plenty
: of whom use STs to control their studios. What I'd like to see is Atari
: repackaging the ST's technology and TOS in a box that was aimed at this
: market. Such a product should

: be in a single unit (built in hi-res LCD, trackball, QWERTY Keyboard but
: maybe smaller than typists need.)

: be in a portable, rugged, spilt-beer-proof case (not-clamshell) suitable
: for gigging with.

: cheap (300 pounds sterling) to compete with dedicated hardware sequencers.

: have a commercially standard sequencer (like Cubase or Creator) in ROM
: (or as a plug in cartridge)

: in all other ways be a *standard* ST, ie. no TOS incompatabilities. Users
: should be able to run their fave software directly, and Atari should help
: existing music software companies to put their stuff onto cartridge.

: This shouldn't be very expensive in terms of R&D as the ST / TOS already
: exists. Atari could also exploit it in other ways, perhaps by making the ST
: available as a sub-assembly to be built into music workstations, professional
: mixing desks etc.

: Atari could also canibalise some of their other technology (currently in the
: Jaguar and Falcon.) What about using some of the custom graphics chips in a
: video titling unit? (Perhaps with Colourspace or Minter's latest epic built
: in.) Or use the Falcon and DSP stuff in a dedicated hard-disc based recorder?

: Microsoft, who are a very forward looking company, have already contemplated
: something similar. They're trying to turn office equipment into Windows
: machines. The age of the single, general purpose computer, has already ended.

: philipj@cogs.susx.ac.uk

I like the idea. Although I do not use my Atari for music, (although I
wouldn't mind giving it a try), I think this is a good idea. While it may not
make the company a leader in the battle for most popular computer, it would at
least make some profit and give Atari a more widespread name. Maybe it is
time for Atari to diversify, and use their well designed hardware for other
applications, not just home use.
I think the Jag would be good for video titling. What with hand held video

cameras becoming cheaper, people are making videos and want to present them nicley. This would also work for the making of buisiness videos which, now-a-days use lots of graphics to present them.
Maybe after Atari has made a substantial profit from the Jag and it's up and comming relatives (jag 2, etc.), they will be open to suggestions. After all, after making a games unit such as the 2600 they went on to make home computers such as the 800XL.

Yeah I know, but Peter deserved the facts for the area I live in.
I simply can not just walk into any store and get a CD-Rom for a
MAC. Even the Mac dealers around here do not carry much of anything
in the way of CD-Roms for the MAC.

Also I thought it extremely funny that he used a merchandise liquidator
as a place to get lots of MAC CD-Roms :)

|>

Exactly 1, The Gemini CD-Rom, though I may be getting that Calamus/Pagestream
template CD-Rom I saw advertised in Current-Notes this month:).

But, since I like rummaging through Compton's CD-Roms I do not care that
they can be used on a PC, and Sony Multi-media CD player. I just wrote
a little program to view them on Atari computers and they are now
available to me, and about 150 others on GEnie. (A new version will be
released by the beginning of next week that I will upload to a.a.u.e :)

It is sort of nice to have 20 or 30 windows open with various articles,
search through the databases for words or phrases, automatically lookup
the meaning of words in articles, use hyperlinks, listen to recordings,
you know all that multi-media type of junk. And best of all I can buy

the CD-Rom down the street at the mall, not at a software liquidator ;)

Source record: 16520

The 1040ST is a 68000 based computer (just like the old Macs). It runs at 8Mhz and usually has 1 meg of RAM. It comes with a built in 720kb MS-DOS format compatible drive.

It has color graphics capabilties of 320x200 in 16 colors, 640x200 in 4 colors, and a monochrome display mode of 640x400. You will need a separate color or mono display to take advantage of these respectively.

The ST uses TOS, a mouse based operating system that marries the icons and windows of the Mac with the file structure and conventions of the PC (MS-DOS). It is not, however, compatible with either system's software but it can read and write to PC formated 720kb disks.

It also has MIDI ports for music, joystick ports, standard serial and parallel ports, and a hard disk port.

There is lots of software for it but the supply is drying up fast. The machine is dead in the US (very little support) but still farily active in Europe.

The ST's system documentation is pretty poor and you are on your own as a new user. However, I'd be glad to answer questions as would others on the net.

There isn't a lot of specific Mac Plus software, either, for the same reason:
most applications are written for the entire line of computers, this is
usually done by following the guidelines and called 'clean programming'.

>On the PC , Mac and to a certain extent, Amiga, you have a wide range of
>CD ROM products - games, multimedia, applications (where there are a lot
>of support files). How does the Falcon have 'better support' here?

It doesn't. The Amiga games CD-ROMs are a joke, though, for they won't work
properly with most Amigas, they either are A500/CDTV or A1200wCD1200/CD32
specific, even simple expansions on either of the two may have to be switched
off (or, in the case of the A1200, taken out(!)) to make these games work.
I haven't seen multimedia stuff for the Amiga on CDs, yet, what CD contains
such stuff?

>The point is that SOMEONE has to kickstart the market for CDROMs on a
>platform as small as the Falcon. Atari needs to have at least an
>official add-on drive, and specifically needs to have a Falcon
>package with bundled drive and software.

Nope. There are cheap external CD-ROMs available for a price Atari surely
can't beat, esp. the Apple CD150 and CD300 are selling cheaper than even
the internal Toshiba 4101. There are at least 5 selling CDs with Atari
software. It really wouldn't make sense for Atari to throw money at an
already spreading technology.

>The Amiga has had SCSI (and therefore CDROM) for years, but it
>wasnt until the CDTV and CD32 came out (along with the computer
>add-ons) that we started to see disks for the Amiga.

The current Amiga models do NOT have SCSI, and there weren't too many
things for the CDTV flop. Disks for the Amiga came either specifically for
the CD32 or for all the machines. But there is NO specific C= CD-ROM drive
for the better Amiga computers, the C= CD-ROMs were designed for the A500
and A1200 only! Don't blame Atari (they had a CD-ROM subsystem for the

DMA port all machines besides the Falcon had) for things C= did even worse.

May Cthulhu forbid sinclap to read this as 'there IS only one Atari specific
CD'.

There are:

- Lohrum CDs 1&2

- GEMini CD

- Wohlfahrtstaetter CD

- Atari Developer CD

Most of these are new, the Lohrum CD 2 was published in May this year.

Yes, a nice generic viewer for machines that arent directly supported
by the CD would be nice. Its irritating to see potentially excellent
CDROMS and not be able to get at the info because its in a format
proprietary to a player program thats only available on the PC/Mac.

It would be really smart of CD publishers to standardise on a format
for their CD multimedia products and to include replay programs for a
variety of platforms on the disk. That way they would get a much wider
market for their product and (after the players had been developed)
there would be absolutely NO EXTRA COST in making the software for say
10 different platforms as opposed to one. No need to make seperate disks
for each platform either - just one disk with all the data and player
programs for the target machines.

Again, I'm assuming this aimed at me, a little quoting helps!
No, AFAIK there is nothing for the Atari that has the abilities of Excel in the formatting dept. IMHO a spreadsheet is for doing serious work, not looking good.
The Spreadsheets I mentioned do have graphing, full macro support, and limit import/export.

If I wanted to do a presentation or incorporate the result into a WP, I could always do that. Having said that, LDW does allow you to set bold and underline and K-SPread 4 uses GDOS for fancy fonts and layouts.

Excel is a superb program and I enjoy using it and messing about with it's abilities. I do not however get any more productivity from it than I do from my Falcon and LDW Power.

Theres a lot of software available for the Mac line of computers, but
very little available for the Atari line on CD ROM , never mind the
Falcon specifically. Thats the point I was making. Its stupid for a
Falcon owner to tell a Mac owner that Falcon support is better than
the Mac - its simply not true.

> >On the PC , Mac and to a certain extent, Amiga, you have a wide range of

> such stuff?

Well theres a load of multimedia CDROM stuff for the Amiga courtesy
of the CDTV - Golden Age of Spaceflight, Dr. Wellman, Electronic Bible,
Encyclopaedia of Aircraft. That sort of stuff. Some of it is quite well
done, the NASA disk is excellent with video clips.

As for expansions needing to be removed, with the C= expansions you
usually need to use the main expansion slot so if you have any peripherals
in that slot such as a HD or processor accelerator you are out of luck.
Solution: Use something like the Indi CDROM player which uses the PCMCIA
socket of the A1200 leaving the trapdoor free for things like 50MHz
accelerators....
Or just get a SCSI interface and use a standard SCSI player as CD32
software is system legal and will work through any CD interface.

SCSI is available for ALL Amiga models (except the A600). Generally you get it when you buy a processor accelerator (eg Viper 030 28Mhz with SCSI-II is only 230 UK pounds).

Amazingly, I remember getting ANTIC magazine back in 86 and Atari were 'ready to release' a CDROM drive for the STs then, but they never released it. Talk about being short sighted...

2882. Online DE_RE Atari? Keeping 8bit Alive!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-07-07 10:11:17 UTC
From: moran@bnr.ca
Message-ID: <2vgkc5$crc@bmerha64.bnr.ca>
Source record: 16532
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.advocacy

Following on from the theme of putting old 8-bit
commercial software onto an archive in the interests
of keeping the 8 bit scene alive, how about someone
translating the old reference manuals such as
'De-Re Atari and 'Technical Reference Notes' into ASCII
or postscript files (with maybe a seperate GIF archive for
diagrams etc.) and putting them online for FTPing????

I REALLY believe that the only way of keeping the 8-bit
scene alive is through....

(a) Increased availability of emulators for modern machines

(b) General availability of all the old software for
FTP downloading.

(c) As much on-line documentation as possible, including
all the old reference manuals in computer readable
form.

Just imagine classics like MULE, RESCUE ON FRACTALUS and BALLBLAZER
were available in an archive package with an XL emulator for
PC/Amiga/Falcon whatever. Those old 8bit games are excellent, and
there are dozens more. Theres a lot of people in the Amiga group
crying out for classic 8 bit conversions - imagine you could get
your hands on them in an emulator package. It would be a real
hit with thousands, maybe tens of thousands of new users running
an Atari 8-bit (albeit via emulation) to play classic old 8-bit
software. Show them a few demos and throw in the text of De-Re
Atari into the emulator LHA file and you WILL attract fresh
interest and tempt old users back...

OK, i realise that translating the manuals into text will
be time consuming, but this is the age of OCR. Shit, we've
even got a scanner and OCR software where I work so I'm
willing to try the viability of the idea!!!

Hello Ari. I was wondering if this news groups has a text file that has all ST FAQ (frequently asked questions)
like the IBM and MAC groups have. It would be a good idea to compile a text file like this so that every st user on the
net can benefit from this. I have one of these files for my IBM and it is about 50 pages printed with valuable info from IRQ to harddrive setting to the history of IBM. Something like this would be beneficial to our st users since our manuals suck and never go deep into our wonderful operating system.

>The deal sucks. If you don't get it for $100 tell him to forget it.

No, $150 is about the normal price for a decent used 1040STfm (that is, one with internal power supply and DSDD drive). Most computer stores that I've talked to buy them for around $120 and sell at about $160, without software. I know, because I've been thinking about selling mine. Mat, think carefully about the software you're going to use and whether or not you'll need a hard drive. If you will, then you need an STE, or TOS 1.6 or up, since the old TOS 1.2 doesn't handle hard drives very well. Len is right about it being old (probably '88 or thereabouts), but that doesn't mean that it will break anytime soon. You should try to find out what repairs and/or alterations have been made, what sort of environment it was kept in, and whether or not it's been cleaned regularly. I bought mine new in '89, and it still works as good as new; I don't see it breaking down any time soon.

The most important thing is to consider whether or not it will meet your computing needs. My 1040 was just fine, until I started needing to do some real programming, and then I needed a hard drive and more memory, so I upgraded to a MegaSTE4. Write down what your needs are, and then try to find out if the 1040 will meet them.

>>it.) Can someone give me a brief run-down on the features of the [STs?]
Mat, if your questions haven't been answered yet, why don't you email me software, TOS version, year of manufacture, and exactly what hardware you'll be getting. That way I'll be better able to answer your questions.

Good luck,
Tom Hopper

I hate to give Peter anything resembling support, but...
The drop is to be (and has been) suspected. With the rapid changes in the Apple product line over the last year, a lot of people are waiting to see what Apple will settle on. And of course, with the advent of PowerMacs, people are waiting for more native software and to make sure that Apple sticks with this architecture. I read that this year is expected to be one of Apple's worst, but next year will be its best. We'll see...

For now, I'm sticking with my MegaSTE. It's a better machine anyway. :-)

Regards,
Tom Hopper

Hi Orlando,

Yes, actually there is a pretty decent set of FAQs on the ST floating around the nets. I used to have them but alas I have moved over to a PC now...

They are, however, posted quite frequently here on the COMP.SYS.ATARI.ST group. Be on the lookout for it or perhaps someone might have a copy.

Ari

P.S. I can answer most of your questions - I had 3 ST and Falcon machines over the last 7 1/2 years.

That's why the CDTV was such a success, right? The use of an Electronic Bible
or a computerized (i.e. in the case of the CDTV: low-rez flickering) encyclo-
pedia is rather limited, wouldn't you agree?

> As for expansions needing to be removed, with the C= expansions you

>software is system legal and will work through any CD interface.

Yes? Should I advise my friend so? He owns a 4000/040 w/ Oktagon 4008 SCSI
adaptor and Apple CD150, are you REALLY sure the CD32 software will run?
Would you bet 1000 US$ on it? I'd not even buy ONE single CD32 game without
having it checked first, for I know how 'clean' Amiga games REALLY are.
BTW: The CD1200 comes with the Akiko chip, none of the other solutions
provides the A1200 owner with such a chip. If the CD32 software really is
system legal, this won't make any difference, so why have C= put the chip

on their solution?

> SCSI is available for ALL Amiga models (except the A600). Generally you
>get it when you buy a processor accelerator (eg Viper 030 28Mhz with SCSI-II
>is only 230 UK pounds).

Nope, it comes if you buy a well-designed accelerator. Many cheap ones don't
come with SCSI-II at all, and what if you want to get one later? Only few
are expandable, so with any of the cheap ones you'll have to sell the old
one cheaply. And NO current Amiga except for the 4000T (I forgot this machine
the last time) COMES with it, still.

> Amazingly, I remember getting ANTIC magazine back in 86 and Atari were
>'ready to release' a CDROM drive for the STs then, but they never released
>it. Talk about being short sighted...

So why does one of the former students here own the 'never released'
CDAR 504? Talk about getting your facts straight, the CDAR drives just
happened to flop worse than even the CDTV due to the high price for an
entirely new technology and the lack of software.

Oh sorry, I'll just go out and buy one then. Whilst I'm at it
I'll get a load of my favourite old 8-bit software as the store
is sure to stock all that too. After all, EVERYWHERE stocks
the 8bit hardware and software........

And the point was that emulators and increased software and
documentation would attract users BACK to the 8 bit. Otherwise
its going nowhere fast like some other Atari computer platforms
I could mention.

Anyone for a Falcon emulator????

The CDTV flopped coz C= aimed it at the wrong market and
didnt push it well enough. An example of typical commodore
idiocy and incompetance. The idea of multimedia encyclopaedias
is sound, check out all the products coming out for the PC and Mac.

> >Or just get a SCSI interface and use a standard SCSI player as CD32

> on their solution?

I wouldnt guarantee ALL cd32 stuff to be compatible with absolutely
every possible setup. The 040 processor will cause problems with some
software. This happens even on all systems - some Mac stuff doesnt
like 040s for example. The majority will be though. Its a matter
of checking first. Its certainly better than the dearth of Falcon
software though.

And there are specific cd32 compatible interfaces coming out
which guarantee compatibility with cd32 games if you want peace
of mind. I'd prefer just to use the SCSI port as its a far more
flexible solution.

Only the C= expansion has the Akiko chip built in. The other
solutions simply provide software chunky<->planar conversion.
Its not like the Akiko does anything which cant be achieved
by software, and anyway, few games use Akiko anyway.

Zappo make a PCMCIA drive for the A1200 which provides
Akiko emulation and they state that it works with the few
games that do use Akiko. They also claim 99% CD32
compatibility and have said they have patch programs for
the couple of games that dont work straight out of the box.

> > SCSI is available for ALL Amiga models (except the A600). Generally you

The Blizzard 030, Viper 030, GVP 030 and ICD 030s all have SCSI/SCSI II.
In many cases, you buy the accelerator and then later can buy a plug in
SCSI module for it when you actually NEED a SCSI interface.

Theres also some PCMCIA SCSI interfaces on the market for PCs
and work is under way to write the software drivers that will allow
them to run on the A1200 (or A600 for that matter).

Oh, and if you have bought a SCSI-less accelerator and want to
use CDROM right NOW (and cant wait for the PCMCIA SCSIs) then
you can simply buy the Zappo CD1200 expansion which uses the
PCMCIA slot and is guaranteed CD32 compatible.

I got all the Atari mags at the time and never saw it for sale.
News articles said that Atari had decided NOT to sell the drive.
I guess your student has got hold of one of the first production
run drives. The article DID point out that Atari had a warehouse
full of the things. Which presumably they sold off to interested
dealers/users.

The product was NEVER marketted. But then, you could say the
same about the Falcon......

Mr. Sinclair is an absolute pussycat compared to JAMES NGYUYEN who has wreaked havoc on comp.sys.mac.advocacy. Peter is forcing people to logically evaluate their reasons for remaining with a system that is being abandoned by its manufacturer, developers, and the computing public. I, for one, will keep using my ST until it totally dies, simply because it does what I need it to do.

So lighten up troops, consider Peter like the devil's advocate that he is.

Atari forever (or at least until the ST dies).

-=-=-=-=- FOCUS: Super Street Fighter II -=-=-=-=-

-=-=-=- Includes: Form Letter Example & Capcom's FAX number! -=-=-=-

CAIN's A.C.T. Now (Atari Community Together Now)
Jaguar Writing Campaign

Contact: Len Stys (aa399@cleveland.freenet.edu)
A.C.T. Now Organizer
CAIN Assistant Newsletter Editor
Cleveland Free-Net Atari SIG Manager

Notice: This campaign is made by an organization that is independent
of Atari Corp. This campaign is not endorsed by Atari Corp.

THE GAME NEEDS JAGUAR, JAGUAR NEEDS THE GAME...

Super Street Fighter II is the second most wanted game for the Atari Jaguar
according to the CAIN Newsletter's Most Wanted Games for the Jaguar List.
This game will most likely be just as popular next year as it is this
year so it is a vital game title for the Jaguar to have.

There are rumors that 3DO will have this game in November. This means that
the Jaguar will be the only game system without this popular title.

Atari Corp. has obviously not been able to convince Capcom that they should
produce it for the Jaguar. This means that we are going to have to do
something that we don't normally do... WRITE LETTERS.

There is nothing wrong with writing a company to tell them what you want.
In fact, in most cases, if you don't write them to tell them what you
want, you won't get it.

If you want Super Street Fighter II for the Atari Jaguar, take a few
minutes to write Capcom a letter.

Besides, everyone knows that the Jaguar is the only video game system that
could do the game justice. It would be a pity not to see a quality
version of Super Street Fighter II in the home.

SUCCESS OR FAILURE?

I will be honest. I think the success of the Jaguar depends on ourselves.
Atari Corp. was not able to get many big name third-party game companies to
develop for the Lynx. I do not see how the company can do for the Jaguar
where the company failed with the Lynx.

But we also failed the Lynx in the past. Most of us sat and hoped for Lynx games. We didn't get them by hoping for them. I think if we would have written game companies when the Lynx was first released, we would have seen some big name titles. We are not going to get big name titles for the Jaguar by sitting and hoping for them either.

If the Jaguar does not get the big name titles, another company's system will get these titles. And if this company's system gets these titles, I'm afraid we might see an inferior product become a standard in the multi-media/video game industry. This happened once in the PC industry, I don't want to see it happen in another industry.

FAX IT BY THIS FAX NUMBER!

This month, I would like to see Capcom's FAX machine get a work-out. Yes, you are going to get a chance to use your FAX modem and FAX software.

The Capcom FAX number is: 408/774-3995

The FAX should include a letter which contains the following:

Dear Mr. Tresidder,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II for the Jaguar as soon it is released.
6) A thank you to the person for reading your letter and for considering making Super Street Fighter II for the Jaguar.

The address of Capcom is:

Capcom USA Inc.
Attn: Mr. Corey Tresidder
475 Oakmead Parkway
Sunnyvale, CA 94086

C'mon... let's make it run out of paper! :)

U.S. MAIL IS VERY IMPORTANT

U.S. mail is very important part of this Jaguar letter writing campaign. If you do not have access to a FAX, write to Capcom through the U.S. mail! If Mr. Corey Tresidder is going to be forced to open your envelope, he is going to be forced to to think about telling the President of Capcom that a Jaguar version should be considered.

The address of Capcom is:

Capcom USA Inc.
Attn: Mr. Corey Tresidder

475 Oakmead Parkway
Sunnyvale, CA 94086

Please use the same content format as the one mentioned for the FAX!

FORM LETTER EXAMPLE

(enter date here)

(your return address & or fax number)

Mr. Corey Tresidder
Capcom USA Inc.
475 Oakmead Parkway
Sunnyvale, CA 94086

Dear Mr. Tresidder,

I am writing you to tell you that I really enjoy playing
Street Fighter II in the arcades. I think your company is
really great at making high quality and enjoyable video games.

I also enjoy the Atari Jaguar 64-bit video game system.
I would like to know if your company has any plans to make
Super Street Fighter II for the Atari Jaguar? If not, I would
very much like to see the game for the Jaguar. I think the
Atari Jaguar is the only video game system that can do the game
justice. The other gaming systems do not capture the
greatness of this arcade game.

I will definitely buy Super Street Fighter II and other
Capcom titles for the Jaguar if your company decides to
produce it. The combination between Capcom games and Atari's
Jaguar should shake up the video game industry!

Thank you for reading my letter and for considering
making Super Street Fighter II for the Atari Jaguar. I look
forward to seeing and buying Capcom titles for my system
in the near future!

Sincerely,

(sign your name here if sending through the U.S. mail)

(type name here)

THAT'S IT... Want to see Super Street Fighter II for the Jaguar?
Then do something about it.

In Amiga magazines, fer sure. The Big Business (tm) uses XPress, though
the German XPress ad has been produced with Calamus SL :-).

I currently use WriteNow 3.0. I doubt any Atari one could match it. Apple is
bundling selected Quadra 605's with software apps such as ClarisWorks 2.0,
Quicken 4 and many other titles. These CPU/software bundles sell for about
$950 street. No Atari computer with an 040, 160 meg HD can match the Q605 low
price.

Thats weird, the local Best Buy, WalMart and the Software ect has Mac specific
cdrom titles. Even the the CompUSA has Mac Cdrom titles. However, no of these
places had Atari specific cdrom titles.

2906. SIGMA Card : Back or dead ?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-07-11 21:48:17 UTC
From: yogi@cs.tu-berlin.de
Message-ID: <2vsen1$e53@news.cs.tu-berlin.de>
Source record: 16556

Does anybody know how that SIGMA card is selling ?

* Is it available in Europe yet (some of my ms-moth friends would be interested)

* Compatibility ?

* Price ?

If the jag makes a break as pc-gamecard, i guess it could come back
from the dead. The technical data is very impressive for

* a video card

* a sound card

* a 'co'-processor (it basically blows a full-fledged 468 of the board)

To all those loosing faith:
Sure, ATARI has been dead for years.
C= has been alive.

Now we have seen the walking dead slay the living.

Watch out Mac and IBM - We'll be back.
Asta la vista, baby.

To SINC*** - Oh, just shut up.

P.S.: Who would want to buy an ATARI based on the jag-processor ?
That be something worth leaving the good ole MC68k for, huh ?

(I know my sig is too long, flames ignored)

BYE

Ask in rec.games.video.atari or in c.s.ibmpc.*, they'll know more about the current status of the board.

>* Compatibility ?

Not compatible with cartridges, AFAIK, only with CD-ROMs.

>If the jag makes a break as pc-gamecard, i guess it could come back
>from the dead. The technical data is very impressive for

Apart from some Amiga-zombie in Berlin, nobody has yet realized the Jaguar was dead. It is not even shipping to Germany officially, AFAIK, due to the high demand within the USA.

>To all those loosing faith:
>Sure, ATARI has been dead for years.
>C= has been alive.

Yes, yes, the Amiga always has been a vivid games machine within Germany. Still, there are hardly any 'serious' applications besides in the video and graphics applications market, and the Toaster is not available in a PAL version. Bad luck, eh?
And I don't get it. In what respect has ATARI been dead and C= alive, besides the games market?

The currently-shipping version of PageStream is 2.2. I have used it extensively. It's very buggy, especially in the import modules. It also gets *very* slow on multi-page documents. It's text display is also painfully slow for non-CG fonts.

To call it the best on ANY system is either naive or stupid.

I quite like LDW Power. It can read Lotus 123 r2 sheets which covers most needs
apart from 3d work but in many years of writing/using spreadsheets, I've never
needed 3d. It has good graphing, full macro compatability with 123 and you can
set bold/underline etc on fields. Best of all, it cost me 19GBP from Compo.
I tried Logistix. Nice but I couldn't stand the character based i/face.

Softlogik has come out with version 3 for the Amiga, which I presume is
faster and generally better than 2.2b. Anyone know if version 3 is comming
out for the Atari?

Yeah, and the latest news is that the high bid for the remnants of C=
is about $1.5 million, way less than anybody thought. Seems the
innovative Amiga chip technology is being overpowered by newer, faster
processors. The funeral will be quick and quiet.

That sounds great. However, while WOLF is a classic, I don't see how it will be the "killer draw" title that SONIC was for the GENESIS as several hundred thousand kids and adults can play the game on the PC already. Faster speed, a few additional levels, and enhanced graphics aren't going to be enough for me to pay $50 for a game I already have and enjoy on my PC.

Alien vs Predator is a different story though...

Actually, for light to moderate use, the Spreadsheet module of ATARIWORKS was pretty decent. It had the ease of use that rivals EXCEL but suffers from the lack of LOTUS 1-2-3 incompatibility which killed me during Managerial Accounting this last semester. It also can't be used practically w/o GDOS.

Otherwise it showed the potential of Atari application software.

It would flop heavily due to the fact that there already are two publishers
available for the Atari. So why should they do that?

Atari Works is included in the list of spreadsheets I have tried, and
I didn't like it. It doesn't support many of the date functions I used
in Logistix, and seemed pretty buggy (it can't cope with my monthly
invoices, and they're only a 4 by 3 sheet!).

2922. SO MANY ATARI BASHERS HERE LYING out their "A**ES"

Newsgroup: comp.sys.atari.advocacy
Date: 1994-07-13 18:38:00 UTC
From: game.guru@teaminfinity.com
Message-ID: <76.370.249.0N9667BA@teaminfinity.com>
Source record: 16574

I may not be the only one sick and tired of the OBVIOUS JAMMING going on
here by people lying so much that only the dumbest could not tell their
motive and lack of fact. So, many might say well what is your point if
everyone can tell the bashers are lying, Well here are two points:

1. You cannot see the forest for all the trees in this NewsGroup
due to the barage of ATARI BASHERS here not using the
NEWSGROUP system in a responsible manner. Trying to take
up bandwidth to promote some corporate interest, namely
hurting another corporation via guile and skullduggery.

2. By lying and holding back a legimate technology these
blabbermouths are holding back technology as a whole.
This may seem like over generalizing, but if someone
has something good to say about a legitamate game system
but cannot get a word in edge wise and because of this
in a collective fashion the legitamate system is never
received well in the public and flounders, the other game
systems have survived not due to better technology
but thru shear numbers of false witnesses and other hooligans.
So now the reigning game systems feel not urge to improve
their tech. If they do not improve their tech, the company that
got squelched has no reason to improve on theirs and so on and on
ad infinittum. Thereby WE ALL LOSE.

GAME OVER

CASE in point:

Someone posts a message titled DOOM 160x140 rez

Then everyone starts arguing about this.

What a joke. If it were not for the shear number
of negative messages like this that are also
NOT based in fact at all, I would have nothing
to say.

We are not biased and hope that everyone could come out with
newer, faster, funner, game systems. There should be no
artifical limits to game play or the expression of speech,
Notice speech, not random ASCII characters that are supposed
to be taken as fact. (i.e. JAMMING via PROPAGANDA) Organize
those bytes into a new game instead of negative propaganda.
It is easy to spout here and there negative things. Much harder
is it to spue out a stream of bytes that makes the next
revolution in games.

A COMPANY THAT SHOULD BE WORKING ON JAGUAR GAMES

Electronic Arts is probably the best producer of sporting games for the PC
and for video game systems in the world today. The company has a number of
popular sporting titles out and these include: John Madden NFL Football,
NBA Showdown, FIFA International Soccer, PGA European Tour Golf,
NHL Hockey '94, MLBPA Baseball, and Mario Andretti Racing. Electronic Arts
publishes great sporting games--it is a fact.

Electronic Arts is also known for producing games like Wing Commander,
Escape from Monster Manner, Twisted, and many more.

It is widely-known in the video game industry that Electronic Arts has been
supporting the format of 3DO since before the first system was sold. This
is because the founder and past CEO of the company started 3DO.
Trip Hawkins has also been known to take shots at Atari Corporation and at
times ignore that the Jaguar was any competition.

The goal of 3DO is to make 3DO the standard multimedia and entertainment
system format. Just like the PC is today. But the Jaguar is faster than
the 3DO and better in some areas. Is it right for one system to be a format
when it is less capable than other systems on the market today?

Recently, Trip Hawkins resigned as CEO of Electronic Arts to concentrate
on 3DO. This is good news for Atari Jaguar owners! It means that
Electronic Arts may be open to producing games for the Jaguar and there

have been rumors that say this is true. Electronic Arts does have Jaguar developing units--they just have to start using them.

GREAT GAMES FOR A GREAT SYSTEM

Electronic Arts produces great games and there is a chance that you might see these great games for the Jaguar if you write the company a letter. If Electronic Arts starts producing games for the Jaguar, the Jaguar's success is pretty much definite. The company supplies sporting games to people that demand sporting games for their system.

The key is to write. If you do not write, nothing will happen.

Electronic Arts has always been known to listen to letters and if there are enough letters sent to the company, the company will seriously consider making games for the Jaguar.

The letter should contain the following:

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your 8-bit Atari (if true) since the company was started.
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to hits high-performance/low-cost.
5) The games that you would love to see on the Jaguar (choose two or three Electronic Arts games).
6) How you believe Electronic Arts' games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games if they produce them for the Jaguar.
8) How you will show your friends what kind of great games EA makes for the Jaguar.
9) A thank you to the person for reading your letter and a thank you for considering producing games for the Jaguar.

The address of Electronic Arts is:

Electronic Arts, Inc.
Attn: Production Teams
P.O. Box 7578
San Mateo, CA 94403-7578

It is important for you to take a few minutes out of your day to write. If you do not live in the United States, please write the Electronic Arts in your country.

I suggest that you write your OWN letter, but you may use the following as an example letter:

FORM LETTER EXAMPLE

(date here)

(return address here)

Production Teams
Electronic Arts, Inc.
P.O. Box 7578
San Mateo, CA 94403-7578

Dear Sir or Madam,

I am writing you to tell you that I really enjoy playing Electronic Arts games. I have played games made by Electronic Arts since I owned my Atari 8-bit computer. I purchased many of your games and I had a lot of fun with them. I have supported your company for a very long time.

I now have an Atari Jaguar and I believe that it is the best video game system on the market today. I believe that it will be very successful in the future due to its low price and high performance.

I would like to see Electronic Arts games for the Jaguar such as John Madden Football, PGA European Tour Golf, and FIFA International Soccer. I would also like to see games like Super Wing Commander, MLBPA Baseball, Twisted, NHL Hockey '95, and Mario Andretti Racing.

I believe that Electronic Arts games on the Jaguar will be unbelievable with the graphics, sound, and speed of the Jaguar. And because the Jaguar will have a Voice/Data Modem, EA can make all of the games with modem and networking capabilities!

I will buy Electronic Arts games for the Jaguar and so will all of my friends that have Jaguars.

Thank you for reading my letter and for considering making Jaguar games. I look forward to seeing Electronic Arts games for the Jaguar in the near future!

Sincerely,

(sign your name)

(type your name)

THAT'S ALL

All there is left to do is write! Can we do it? Yes, we can! Remember that success is... more attitude than aptitude.

The current PCW magazine (UK) has a feature on a PAL version of the toaster
(it's actually the standard version, but with format converters). 8K GBP
to 12K GBP.

I am not to happy about A v P. It was supposed to be out in like March.
It is not July. I called a store, and they said it was delayed until
MID SEPTEMBER! Looks like Atari is up to old tricks. It better be the best
fucking game ever developed!

Wolf 3D might be cool. The store I called said it would not be out until
the end of the month, so maybe I need to hunt around. (Or wait . . .)

They said "Brutal Sports Football" was due out very soon (under 1 week).
At least by XMAS there should be a good set of games available.
(Will A v P be out by december ?!?)

Electronic Arts support any Atari product? Fat chance. Ever since
they openly espoused the Amiga over the ST, they have ignored or
insulted (the ST conversions of Music Construction Set & Marble Madness
spring to mind) Atari users. You'd have a better chance of getting
Lotus to port 1-2-3.

I agree that a lot of people have had exposure to Wolf, Ari,
but there are a lot of people who don't have 486s, etc.
Mac users, ST users, and Amiga users for instance. These people
alone are a big enough market for Atari to sell its 500,000 Jags
or so this year to.
About 10-14 year olds: their parents will buy them Jags for Xmas
(hopefully :-)). Look at the mentality of the gaming magazines
and tell me that they are geared towards adult readers! But,
you're right, 10-14 probably was a little on the low side.

Hi Scott!

There are at least 60-70 million PC clones in North America by now. A vast majority of them are installed in middle and upper-middle class homes. Most of the video game market is aimed at the kids of those families. It's a safe bet that a good number of them play with their parent's PC.

BTW, how many 10-14 year olds own Jag? I think the bulk of the users are a bit older and tend to be real enthusiasts (like 19-35).

This of course might change very rapidly once Atari starts a REAL marketing campaign...

Ari

>

That's because you had all of those Amiga users writing letters to Electronic Arts in every part of the world. If there is one thing that I admire about the Amiga Community, it is the fact that when they want something, they make sure that they get it.

Besides, the Amiga was a bit more funner to make games for. In fact, it was originally made to be an expensive game machine! Can you imagine if it was released as a "interactive multimedia system" for $300 or $400 without disk drive, keyboard, etc.? It might have been the "standard" that 3DO is attempting to be today.

I have heard from a lot of Jaguar programmers that they feel the Jaguar is fun to program as well. If they feel it is fun to program, they will do what they can to make their games good.

AvP has been continually delayed because Atari is committed to putting out
only high quality games under their name. They could have put it out
earlier but would have probably taken flack by the gaming community for
releasing a game before it's time. I personally prefer the delay if it
means a much better overall game design.

There isnt even a CDROM drive for the Jaguar yet! So until we
see a Jaguar CDROM you can forget about this card.
Here, Atari hasnt even been able to get the basic Jaguar out.

> >If the jag makes a break as pc-gamecard, i guess it could come back

Sales arent anything LIKE Atari were hoping for. With the PSX
and Saturn about to shit on it from a very great height I think
its safe to say Atari have blown it, YET AGAIN.

(9 months after release and still only 5 games. Gimme a break!)

> >To all those loosing faith:

> Weregoose

And apart from an ever diminishing presence in the Midi music market,
since when has Atari been able to boast any sort of life? Maybe early
on in the games market before the Amiga killed off the ST. At least
the sheer numbers of Amigas guarantee a stream of useful productivity
software (eg Pagestream 3, ProPage, WordWorth 3, Final Copy 2, Superbase Pro)
whereas the ST is much weaker in these areas.

You dont need a 486 for Wolf, even a 286 @>16Mhz will do the
job quite nicely. Not that Wolf is much of a desirable game
any more. Its been totally eclipsed by Doom. Thats what might
give the Jaguar a boost.

The problem is that the console market is in decline, most
expert opinion seems to be that the shift in gaming trends is
towards more complex, adult oriented games, the soft that a
home computer can do MUCH better than consoles.

The wheel has turned full circle.

Actually (from my recollection) I remember those goofy 'We See Further'
adds in the first issues (if not the first one) of Amiga World (which I
recently got rid of - I should have saved the Andy Warhol issue though).
EA (back when they were called EOA by everyone)..

Is that Trip is those adds?

EA made some good games back then... (esp for the Amiga)

You are, of course, joking. Aren't you? Have you ever seen a real marketing campaign from Atari? In the computer world, never. In the gaming world, not since the Tramiels took over.

Atari reminds me of the cheerleader I used to date...I'd spend lots of time and all my money, but when my hand started going under her sweater for some real action, she told me "not yet, I'm not ready, maybe later". Finally I got wise, found another girl. She wasn't a cheerleader type, but she was ready.

I've been living in the Atari world for a number of years, and, sad to say, Atari nerver made the transition from hobby machine to mainstream. Their products are (or used to be) as good as anybody's (arguably better), but they never capitalized on their technological superiority when they had it.

At this point I'd doubt whether Atari had the resources for both a major marketing campaign and the substantial production increase requierd to support the marketing effort.

You know, sometimes I still think fondly of that cheerleader...

Gavan,
You really believe that Atari is worse off than the Amiga in DTP, database and word processing? What about Calamus SL for DTP on the Atari? How about AtariWorks, Papyrus, That's Write, Redaucter (sp?)? There are also some good DB programs from what I hear (I don't know of them since Atariworks handles my needs).
I also disagree that the Amiga killed the ST in the game market. Pirates and Atari killed the market. There is just as much validity in me saying that Atari killed C=. C='s inept management did them in, IMO. Both the Amiga and the ST will have new programs coming out for them, Gavan. I personally have quite a bit of faith in Compo, Lexicor, Gribnif and Hisoft to name a few.

Some people would also argue that Street Fighter II has been eclipsed by Mortal Kombat, Gavan. However it should be a good boost to the 3DO to get that game. IMO, Wolfenstein can only help the Jaguar. It is a big name game and still one of the most popular games for the IBM. I would also say that it fits into your criteria of being a complex, more adult game. There is a bit of strategy involved (certainly more than the beat-em-ups in every arcade). The Jag CD should be able to handle more complex games. IMO, nothing I've seen on computer CD has been too earthshattering.
But, you do have a point. Civ would probably be hard to do on a console.

Nah. Carl is right; when the Amiga was merely an announcement from Commodore, Electronic Arts was already there, backing the machine with everything they had. There WERE no "Amiga users" then to write letters.

Electronic Arts started as a small shop that produced really cool software (ARCHON, PINBALL CONSTRUCTION SET, etc.) and supported everyone equally. Then they degenerated into a chop-shop for quick hacks (RACING DESTRUCTION SET, MAIL ORDER MONSTERS, etc.). Then they degenerated further into an Amiga-cheerleading crowd, while maintaining a false facade of multi-platform support.

Now it's a conglomerate-building monster that swallows up other software houses (Origin, anyone?) in an attempt to be the Microsoft of the video gaming field. And with Trip Hawkins backing the 3DO with his reputation, I expect to see Lotus 1-2-3 *and* FrameMaker on the Jaguar before I see EA put a title there. I'd like to be pleasantly surprised, but I'm not holding my breath.

Racing Destruction Set was a quick hack? Come on, that was one
of the greatest C64 (or 8-bit computer, for that matter) games of all time.
A TON of options and everlasting playability. Of course, I really don't
think that EA is as great quality-wise as they once were.

While it is true that EA had a lot of stuff out for the Amiga when it was
first released, EA also had a lot of stuff for the ST when it came out.
There were a FEW more titles for Amiga than ST, but that is only because the
ST was heading towards the professional market and Amiga was heading toward
the gaming market.

There was also a time when EA didn't want to make some games for the ST
and Amiga. They forgot about the ST, but then decided to go ahead and make
the software for the Amiga. I remember at that time that Amiga users
were writing letters to EA to get some of these games. ST users were not.
That might be because ST users seemed to be jumping ship faster than
Amiga users.

The Amiga was getting very popular in Europe around 1990 while the ST was
decreasing in popularity. Also, PCs were selling in the millions.
EA had to make some tough decisions and unfortunately, they decided to start
concentrating on PC games and some Amiga games--leaving out the ST.
This is also when I noticed the company starting to get serious about
home video game systems.

Electronic Arts still makes some very good games. They make the best sporting
games anywhere.

I don't know if we will get EA to make games for the Jaguar? Did you write
Rob? If not, we probably won't.

Scott:

To a point, I also agree w/Gavan - you can't play games like Falcon 3.0 or Ultima Underworld on consoles either. It has been tried before and usually has failed. These games take patience that many video junkies (kids) don't have and resources that the majority of the installed console market doesn't have (20-30 megs of space).

We also have to understand one important fact! Most of the AMERICAN consumer public doesn't know about the Jag! Unlike SEGA or NINTENDO it isn't a household word! Just imagine if Atari did a video commercial featuring WOLF-3d where your character is blasting holes into Nazi's and put it on after the Simpsons! Demand would be so great that Atari would only have to air the commercial once or twice!

Until Atari markets the Jag effectively and irons out distribution problems, getting big name developers will be the least of their problems.

You don't hear of kids getting "Jaguar elbow" or here RAP groups like The House of Pain rapping with lyrics like "played you like Jaguar", do you?

Ari

My hazy memory says it was more than "a few". And didn't the first Amigas
come with Electronic Arts sample disks? I do distinctively remember an
article on the Amiga in CREATIVE COMPUTING, and it included an entire half-
page sidebar on EA software for it, even before the machine's release.

Yeah, but I think EA started to slide even before the 68000-based machines
arrived. They were producing schlock for the Commodore 64 and 8-bit Ataris,
even.

I know. I exaggerated, but only a little. Still, EA is now no better or
no worse than any other software house, whereas before they used to care
about producing a polished product. Kinda depressing, actually. Then
again, I'm in no rush to see NORMY'S BEACH BLANKET BABE-O-RAMA ported to any
other machine...

This probably won't have much relevance outside the UK, but Littlewoods has taken the Jag onto their books. The latest catalogue dropped thru my door today, and there it is, described as "The most powerful games machine there is" and "Mind-blowing graphics and sound". So all the kiddies looking through for Xmas presents will see this alongside the Nintendo's etc.

Things are looking up if the comparatively staid and conservative catalogue companies are supporting the Jag :-)))

Simon.

To; game guru

Sorry to do more "bashing" but the real reason that Atari lacks ANY significant presence in marketplace is that they will no do a proper marketting job and maintain a constant supply of product to the retail channel.

Yesterday I went out to buy my nephew a game cart for his Lynx machine. The only thing I could find in Louisville, KY (a metro area of 800,000 people) were about 8-10 worn out boxes in the close-out section of a Toys-r-US. Had he used a Game Boy or Game Gear, I could have gone to any of a dozen retailers and chose among 50 to 100 titles. This was not always the case.

I bought my first Atari at Zayres, there were disk drives available at K-Mart and Service Merchandise and software was sold at both department stores like Sears and computer stores.

By the time the ST came out, you could only buy it at 1 or 2 computer stores in the area and those slowly vanished. Over the next 4-5 years, the Atari barely changed in capabilities, while the PC and MAC systems grew in capabilities. When my needs started outgrowing the old 8-bit and I started looking for new systems, there was no way that I was going to sink a thousand $ investement in a system with minimal support.

Until such time as Atari starts to truly support their machines with marketing and support their dealers with a steady supply of machines, I refuse to support them. In the meantime, my dollars, like those of millions of other computer users, will be going to the hardware and software manufacturers who support the PC system. It's a sad state of affairs but it is SOLELY the responsibility of Atari to build the market.

If you're happy with the programs you use then there is no problem. It does seem however that Amiga programs are a bit more up-to-date and well supported in this area though. Not that this matters, since if you really want the best business software then a PC is the obvious choice.

> to name a few.

Piracy certainly did have a big effect. Atari games sell in minute quantities here, certainly the proportion is much smaller than the actual number of Atari to Amiga owners. But it was the sucess of the Amiga, combined with high levels of Atari piracy, that led to software companies dropping the ST and going to the Amiga. Sadly, the same thing looks like it is about to happen again with companies now going to the larger PC market because of Amiga piracy.

Certainly both machines will see new software, but not in anything like the quantities that a typical user would want to see. At the moment the Amiga is well supported, but if noone picks up the Amiga computer line then we can expect to see support for it tail off as Atari support has done in the last few years. Still, the larger installed user base should be mean that the machine is viable for a year to 18 months yet, which given the fact that C= were doing bugger all to develop the Amiga, was about as long as it would have lasted even if C= had lived. I'm happy with my Amiga and will continue to use it, but eventually I will probably have to get a PC thanks to Commodores greedy, inept, clueless management.

Agreed that Atari has to market the Jag. However, anyone who reads
gaming mags (other than Nintendo Power or other console-specific
publications) has heard of the Jaguar. Also, the commercials on
MTV were a good start (not to mention a commercial during the
tv premier of Terminator 2!). Atari says that August or September
are the times when they will advertise. We'll see. If they
do have $20 million or so to concentrate on 3 months up to Xmas
and have out Doom, AvP and ten or so other games then the Jag
will sell.

I agree that it is much easier to find clone hardware about
but I don't think that is all there is to supporting a machine.
Besides, look at Computer Shopper and tell me that people aren't
going the mail order route in the IBM world. Support for clones
at, say, department stores is ridiculous. The salespeople do not
know what is going on plain and simple. Try getting a technical
question answered at Radio Shack. I am not saying that it is
never inconvenient having an Atari but for me the hassle is well
worth it (especially when I compare Windows to TOS 4.04). Oh
well. For Lynx games call: (800) 448-TOAD for Toad Computers :-).

Once again, Apple Computer revamps the Quadra line with new models to give users more bang for the buck.

Apple intoduces the Quadra 630 series as well as its Performa and LC sibblings. The Quadra 630 uses a 33mhz. 040 with FPU(!) and is priced at $1279 for the 4/250 configuration. This model has greater expansion than the now discontinued Q610 with four expansion slots.

Meanwhile the Falcon has not changed and has lost its price/performance by a wide range...

The problem is Scott, that Atari probably doesn't have $20 million to spend on Jag marketing and that makes all of the difference.

I think that this time Atari really wants to market one of their products but finally realizes that they can't afford to effectively.

The Nintendo Saturn is due out soon. Nintendo has such an advantage already, Atari is dead is sh*t doesn't start happening REAL soon.

Toad is very good and I also recommend them. However, in a market oriented economy like ours, we shouldn't have to rely on just a handful of vendors to buy our hardware. The ability to buy PC stuff virtually anywhere has been a major influence on keeping PC prices down.

Word to the wise - only idiots and COMPLETE computer novices buy their computers from department stores!!! Those who know better also know how to shop and where to go...

Wasnt everyone saying this around this time LAST year?
'the Jaguar is coming out in October and Atari have a big TV
ad campaign planned and there are 10 plus games ready for
release on launch and this time they are going to get it
right.'

For crying out loud, it's 3/4 of a year after release and there
are still only about 4 or 5 games and the console is still
relatively low profile. Sure people have heard of it but many
have seen the promises and have seen the sparsity of software.
Do you really think they are going to buy a Jaguar unless there
are a LOT of high quality games available at the time of purchase?
People DO remember the Lynx and other great past Atari screwups.

With the PSX getting a lot of high profile coverage, I think
that diehard gamers are more likely to wait for it. Yes, even
though it is just vapourware at the moment the general public
has a lot more faith in Sony to deliver the goods than they
have in Atari to provide good software support for the Jaguar.

The saddest thing is that if Sega or Nintendo had marketted the
Jaguar you would be seeing DOZENS of high quality Jag games right
now and the system would be phenomenally popular.

Instead, Atari have it. What a shame for the Jaguar.

Once again Apple has pissed off a lot of users; all those people who bought the 610 when it was brand new 6 months ago. Very poor marketting, and like the IIsi will probably send a few users over to the PC. The 630 may *sound* like a good idea, but only if you want a dead machine; within four years it will be hard to find 680x0 software for it, and to upgrade will cost more than a new PowerMac. Anyone with any intelligence wouldn't buy it, and wouldn't sing it's praises. The PowerMac, on the other hand... well, we'll just have to wait and see if Apple survives the transition.

>BTW why do yout bash Atari users... try to bash on the far more DOS and
>Windooze bozos...

Have you ever tried to convince a DOS user to upgrade to Windows? It's only marginally harder than convincing a Windows user to upgrade to Mac. People are just afraid of trying something new on their computers (it took them SOoo long to figure DOS out; why go through THAT again?). It's why the outdated DOS and Windooze have survived as long as they have; talk about an *installed* user base! Atari users, on the other hand, have a better system to start with, and most would never fall back into the dark ages by buying a PC.

And of course, lets not overlook the fact that Sinclap (sounds like some sort of disease, doesn't it? "I've got the sinclap, but the doc gave me some medicine...") hasn't a life, let alone interpersonal skills. Apple should pay him to stay away from PC users; he's a good argument to avoid Macs entirely.

Ari,
There are no competent clone dealers in the area where I live.
Yes, there are clone-specific stores who build their own
machines but I have found the people there rude and the products
over-priced. I bought a Hayes 2400 baud modem for $70 at
B & C Computervisions while this place had 2400 baud modems
for $170, for example. Mail order is where a lot of people
do their shopping. Depending on a few mail order houses is
not bad if they are competent and dependable (which includes
Toad, B & C, Computer STudio, Rising Star, ATY, Steve's....).
I don't see why these places are any less acceptable than an
advertiser in Computer Shopper.

Making a firm judgement right now is foolish. Anyway, I commend what I feel Atari is trying to do with Jaguar development. They are trying to get the highest quality games possible out like Wolf 3-D and Tempest 2000. Face it: for a lot of people a networkable Doom, Wolf 3D and Tempest 2000 warrant the purchase of a Jag. At $60 a pop how many games do you want to buy before you get a good one? Yes, the Genesis has oodles of games but how many of those games are crap? Quite a bit. When it is Xmas time and the Jag has 10 system selling games out (my prediction) it will fly off the shelves. CFII, AvP, Tiny Toons, Wolf 3D, Doom, T2K, Club Drive, Rayman, Iron Soldier and Ultra Vortex (oh, and Kusami Ninja....). Hmmmm.... I guess I'm just an optimist :-).

CAIN Atari Fun Fest 94
----------------------

UPDATE: Atari Corporation will be donating -=- 3 Jaguars -=- and
-=- 3 Tempest 2000 Cartridges -=- to give away at the CAIN Atari Fun Fest.

There will be other prizes being donated to raffle off at the show.

If you aren't doing anything on August 7, 1994, you may want to stop by
Kirtland, Ohio for one of the greatest Atari gaming shows!

CLEVELAND, OHIO is within 500 miles of half the population in the United States
and a very LARGE population of Canada.

The CAIN Atari Fun Fest 94 will be held in Kirtland, Ohio (very close to
Cleveland) and will allow Lynx and Jaguar owners to have a lot of fun!
There will even be a "Cleveland Lynx-Up" where Lynx owners can bring their
Lynx and game cards and comlynx with other players! Who says that you'll never
get the opportunity to comlynx???

There will also be dealerships attending this show that will be more than
happy go give you great deals on game systems and game cartridges!

If you are an Atari computer gaming fanatic, not to worry! There will dealers
there to supply you with all your computer gaming needs...

ALL INTERESTED ATARI DEALERSHIPS AND USER GROUPS SHOULD CONTACT THE SHOW
ORGANIZERS AS SOON AS POSSIBLE! Great spaces are on a first come basis!
Atari user groups are given tables for free!

PLEASE distribute this on BBSs, networks, and at your user group meetings!
We want to have one heck of a gaming day! And a gaming day that might be
closer to you than you think!

CAIN Atari Fun Fest 94
----------------------

Central Atari Information Network
Presents
C.A.I.N. Atari Fun Fest 94
August 7, 1994 / 10:00AM to 5:00PM
Knights of Columbus Hall
7637 Chardon Road
Kirtland, OH 44094
```

>A Mac running at 33Mhz is not noticibly faster than a 16Mhz
>Falcon, IMO. Also 4 megs of RAM on a Mac is too restricting.

A 33MHz 68040 (with the FPU) is roughly four times as fast as a 16MHz 68030. Even though the Falcon has custom support chips which lessen the load on the main processor, there is no way anybody can honestly claim that a 16MHz 68030 is NOT perceptibly slower than a 33MHz 68040. There's also the fact that the Falcon's DRAM-based video significantly slows down the machine, especially at resolutions of 640x480x256 and higher. Sure, you will probably claim that the TOS is faster than System 7, but even if it were faster, software can only do so much to overcome such a huge disadvantage as that of a 16MHz 68030 compared to a 33MHz 68040.

>I will admit that the 250 meg hard drive is nice but the
>average Mac program takes up much more storage space than the
>average Atari program.

As for 4Mb of RAM, that is enough to comfortable run one or two medium-sized applications under System 7.1 if you don't go overboard on memory-hogging extensions. 250Mb is a nice size for a hard drive -- I have a 160Mb hard drive on my Mac with several major applications, and I have no problem with space. 250Mb should be fine for any regular Mac user (ie, someone who doesn't have multi-megabyte 24-bit photos to edit.)

> Does this Mac have a DSP? I don't know,
>but I'd still rather have my Falcon.

Any time someone compares a Mac to the Falcon, an Atari owner asks, "but does it have a DSP?" No it doesn't, but face it -- the Falcon's DSP isn't used for much except decoding JPEGs in GEM-View and some sound programs. I would think that having a processor that is four times as fast as that in the Falcon (not to mention a 32-bit bus -- I've heard that the Falcon's bus is 16bit, but I am not sure about that) as well as one with an integrated FPU would be much more useful to the average person.

You must be joking. Ever heard of multimedia and desktop video?
The home computer market?

Of course, C='s dead now, but even when it's dead, looks more
alive computerwise than the ST.

Gavan, I disagree with you here. The console market
shows GREAT potential and no signs of erosion. The only
problem I see is the upcoming "system wars" that will leave
everybody weak at first but then the strong will survive.

And 3DO sold over 300,000 units according to a press release. Of course, as it was pointed out later, they were lying.

Not saying that good old ATARI did the same, but just to add a little suspense. ATARI is losing their break with the Jaguar. Looks like the 32x for the SEGA will eat it. I give ATARI 1.5 months more to start advertising like hell with some good games or die.

|> right.'

Yep. I do remember that. But Gavan, I actually believe
that they'll put out at least 3 good games on the Jaguar in
the next two months (August/September).

|> For crying out loud, it's 3/4 of a year after release and there

|> have in Atari to provide good software support for the Jaguar.

I would say that after reading today's GamePro and EGM, SEGA
has a very nice chance of kicking everybody's butt with
the '32X' for the Genesis. A $150 add on that will guarantee
32,768 on screen colors, fast polygons/textures, Q-SOUND (YES,
Q-SOUND BUILT-IN), 2 32-bit Hitachi 22 Mhz chips and a graphics

coprocessor.

I would say this would guarantee SEGA's customer base at
least in the US.

|>
|> The saddest thing is that if Sega or Nintendo had marketted the

|> now and the system would be phenomenally popular.
|>
|> Instead, Atari have it. What a shame for the Jaguar.

True, the Jaguar does deserve better. I am giving ATARI 1.5 more
months... after that, goodbye ATARI.

Excellent point. To get the kind of memory usage out of a Mac that you get out of a 4Mb Atari requires a good 8 Megs, or another $200. Of course, on a PC w/Windooze you're talking closer to 12... :-)

>I will admit that the 250 meg hard drive is nice but the

>average Atari program. Does this Mac have a DSP? I don't know,
>but I'd still rather have my Falcon.

Anything without the AV label is going to lack a DSP. For anything less than pure number crunching, the Mac w/fpu is going to be about the same speed as a Falcon w/fpu, and in some cases (screen redraw vs. NVDI, for instance), the Mac will actually be quite a bit slower. My MSTE4 (16MHz 68000 w/cache) with Warp9 does screen redraws (windows open/close, scrolling, etc.) faster than a 25MHz 68040 Mac (Q610 or Q605). Too bad Sinclap can't read; only us smart Atarians will ever read this. ;-)

CAIN's
A.C.T. Now
Atari Community Together Now

Lynx Letter Writing Campaign

First Campaign Focus: Lynx Distribution

Len Stys (aa399@cleveland.freenet.edu)
A.C.T. Now Organizer

INTRODUCTION

The Lynx is an incredible portable video game system. The Lynx is the only portable video game system on the market today with a 16-BIT graphics engine (the others have 8-BIT). The Lynx radiates 4,096 colors (more than any portable on the market today). The Lynx has a 10 percent larger screen than its closest competitor. The screen is also recessed and back-lit for better viewing. All of that, plus stereo sound, a battery saver option, and the largest selection of multiplayer games in the world!

The Lynx and its related products, however, cannot be found in any stores! Maybe the reason why the Lynx cannot be found in stores is because of poor marketing of the product in the past. Maybe it is also because Nintendo and Sega are retailers' favorite companies due to the Super Nintendo and Sega Genesis. For whatever reason, you cannot walk into one major retailer and buy a Lynx game.

Atari Corporation will not release sales numbers for the Lynx. But it is believed to be close to 1 million. This number isn't bad at all. And if you think about it, there must be demand for at least one major retailer to sell Lynx games!

ONE RETAILER ONLY

This campaign will be concentrating on only one major retailer to carry the Lynx and its games. Why only one major retailer? Right now, there is no more room for more than one major retailer to carry the Lynx. If we were to concentrate on several stores and succeed in getting them to carry the Lynx, the following would happen:

Atari Corporation would concentrate on the Jaguar with most of their advertisements. There would be a few Lynx magazine advertisements, but not enough to create a real large demand for the product and its

related products. All of the major retailers that we convinced to carry the Lynx would have mediocre sales, not fantastic sales since Atari's advertisements only created so much demand. Since demand for the Lynx and its games in all of the stores were mediocre, all of the retailers would decide not to carry it next year.

But if we concentrated on one major retailer to carry the Lynx and Atari advertised the Lynx in gaming magazines, the retailer would have fantastic sales since they are the only place to buy the Lynx and its related products. The retailer would most likely be impresed with the sales of the Lynx and decide to carry it next year.

And then next year when Atari has more money from its Jaguar, the company will be able to promote the Lynx more heavily which will allow Atari to increase distribution of the Lynx.

So if Atari will have more money to promote the Lynx next year, why not just wait until then? The reason we cannot wait until next year for the Lynx to get into more retailers is because there will not be a next year if the Lynx does not retain market presence this year. The Lynx will be nearly impossible to re-introduce into the marketplace next year. This is because retailers will see it as old failed technology that is being re-introduced into the marketplace. There will also be too many new video game products being released next year that will be competing with the Lynx for shelve space.

It is important that the Lynx stay in the marketplace this year and show good sales at one major retailer.

The major retailer that I have chosen for us to concentrate on is Toys "R" Us. I have chosen this retailer because it is the largest toy store and it can be found everywhere in the United States. It can also be found in other countries as well.

TOYS "R" US

Toys "R" Us is the top toy retailer in the U.S. in terms of estimated dollar share of the industry. The toy retailer finished first in a study conducted by NPD Research in 1991 and is probably still first in 1993. Toys "R" Us stores are also very large and is probably the only retailer which will be able to carry most of the games available for the Lynx.

All of the letters will be addressed to Charles Lazarus, Chief Executive Officer and Chairman of the Board of Toys "R" Us. The key to getting the letters to Mr. Lazarus to read will be for each of us to make the envelopes look as professional as possible.

The letter to Mr. Lazarus at Toys "R" Us should include:

Dear Mr. Lazarus,

1) How much you like Toys "R" Us
2) How much you like Toys "R" Us because they support the quality

products that customers buy from them
3) How much you like your Atari Lynx
4) How you bought your Atari Lynx from Toys "R" Us (if true)
5) How you cannot find any games for your Atari Lynx
6) How you believe there is a demand for Lynx games since nobody else is selling them
7) How you noticed that Toys "R" Us is carrying the Jaguar 64-bit video game system and how you appreciate it.
8) Thank Mr. Lazarus for reading your letter and for considering carrying the Lynx and its quality games once again

The letter, of course, should be written as professionally as possible.

The address of Toys "R" Us is:

Charles Lazarus
Toys "R" Us Inc.
461 From Rd.
Paramus NJ 07652

(you may want to write "Important" or "Personal" somewhere on the envelope or if you think the envelope looks really professional, you may want to try it without it)

ATARI CORPORATION

Atari Corporation is the maker of the Lynx. The company does not seem to know what to do with the Lynx or its game cards right now since there is no major retailer carrying the product.

The reason for writing Atari Corporation is to inform the company that you have written Toys "R" Us to encourage them to carry the Lynx and to thank them for carrying the Jaguar. The letter will encourage Atari to contact Toys "R" Us and attempt to convince the retailer to carry the Lynx once again. The letter will also inform Atari Corporation of ways they might be able to convince Toys "R" Us to carry the Lynx.

All of the letters will be addressed to Sam Tramiel, President of Atari Corporation. The key to getting the letters to Mr. Tramiel is by making the envelope look as professional as possible.

The letter to Mr. Tramiel at Atari Corporation should include:

Dear Mr. Tramiel,

1) How much you like the products that Atari Corporation produces
2) How much you like the Lynx
3) How you have written Charles Lazarus of Toys "R" Us in order to encourge him to carry the Lynx and its games again
4) How you have also thanked Mr. Lazarus for carrying the Jaguar
5) How you believe that Atari should try to convince Toys "R" Us to carry the Lynx again this year
6) How you have a few suggestions which may help Atari convince

Toys "R" Us to carry the Lynx again (OPTIONAL):

a) Inform Toys "R" Us that they will be the only major retailer
carrying the Lynx and its games this year
b) State the amount of Lynx owners in the world that are looking for
Lynx games
c) How Atari can advertise the Lynx and ALL of its games in video
game magazines and that it is available at Toys "R" Us
d) How Atari can advertise the Lynx along with the Jaguar in
Toys "R" Us Sunday newspaper ads
e) Lower the price of the Lynx base unit and Lynx Deluxe package
and give a free Super Asteroids/Missile Command game to encourage
sales of the portable
f) Restructure the pricing of Lynx games
g) Stress to Toys "R" Us that the Lynx will be used in future
multiplayer Jaguar games
h) Review all of the Lynx games and sell only the highest quality
Lynx games at Toys "R" Us this year

7) How you would really like for Atari Corporation to release new Lynx
games for distribution at Toys "R" this year
8) Thank Mr. Tramiel for reading your letter and for attempting to
convince Toys "R" Us to carry the Lynx again

The letter needs to be as professional as possible in order to get the best
effect. Try to concentrate on only the things mentioned above.

The address of Atari Corporation is:

Mr. Sam Tramiel, President
Atari Corporation
1196 Borregas Avenue
Sunnyvale, CA 94089

SUCCESS OR FAILURE

The success or failure of this writing campaign depends on you.
If you are serious and write these two companies, there is a good chance
that our goals will be reached. If you don't bother to write because
you either do not have enough time or you think someone else will write,
the letter writing campaign will be a failure.

Another important part of this letter writing campaign is to distribute
this text file. Upload it to online systems, computer networks, BBSs, etc.!
And print it out and encourage your user group members to write!

The future of the Lynx is pretty much in your hands...

Actually, I USE a Mac Quadra 650 with 33Mhz 040 EVERY DAY and I can
tell you that it is NOTICEABLY SLOWER in everyday operation than my
A1200 which only has a 14Mhz 020. Why? Probably because the OS
is such a heap of shit. It may be 'friendly' but it is a dog to use
once you have had some experience and want to learn how to do things
faster - you cant. The point the poster was making was that a Mac
with 33Mhz 040 was actually slower to use - which is quite possible.

> As for 4Mb of RAM, that is enough to comfortable run one or two medium-sized

> multi-megabyte 24-bit photos to edit.)

4mb enough to run two applications - you cant be serious!!!!

On the Mac I use there is 8mb and you can just about run two medium apps
at once. Actually, its not very good at running them simultaneously
since the so called 'multitasking' is so pathetic. Having two tasks in
memory at once would be a better way to describe it.

One of the big problems is that the Mac DOESNT have dynamic memory
allocation so programs grab a big chunk of ram whether they need it or
not and if they find they need more ram than they grabbed, well, tough.
It's frankly incredible that a supposedly modern OS can be as clunky
and slow as System 7.

On my Amiga with 6mb of memory I can happily multitask 3 or 4 medium sized apps,
or even 10+ smaller ones with great efficiency.

I will admit, EA made a brilliant job of Dpaint ST - Much better than
the Amiga or PC version. (Just a little buggy ,s'all).

What I want to know is... What is the deal with the complete Lynx games that have not been released. I have been waiting for Eye of the Beholder, Geoduel, and Cyberdrome for the Lynx. To my knowledge, the games are all finished, but have not been released. I would be happy to purchase directly from Atari, or even our Local (Only) Atari Dealer (Neutronics). How can the Lynz survive if new games are never released?

Well, I dont know how it is in the USA but here in Europe`
the console market is declining. Sales are plumetting of Software,
and hardware sales have stagnated. Basically, console software
houses are looking to produce games aimed more at adult gamers
since kids have deserted the fad. The problem is that with
slow CPUs, limited amounts of RAM and no effective back up devices
and no keyboards, its very difficult to produce more complex
software on the Nintendo or Sega. There arent even enough
people with mice to make mouse controlled games.

Namco stated in a recent interview with Edge magazine that
they were aiming their forthcoming Sony PSX games at a more
grown up market, but that they were also making games that
would appeal to younger players in order to stimulate sales.
Many software houses that left Amiga to do console stuff
have found their fingers got burned and have returned to
doing Amiga stuff.

There is hope that the PSX and Saturn will rejuvinate
the market with their high specs and appeal to grown-ups
so it's not all gloom for consoles. Only time will tell
if consoles are really here to stay. My bet is that if the
PSX is half as good as the hype its going to be MASSIVE.

If only Atari had marketted the Jaguar right it could
be cleaning up now, but of course as we predicted they

have gone and screwed it up. Its possible that a
rejuvinated market might lead to increased Jaguar sales
but I'd say that the bulk of new sales will go to PSX
and Saturn. (forget Nintendos Project Reality, it sounds
like more marketting propoganda like their CD machine and
32 bit Famicom/SNES).

Hmmm, I'm not so sure about the SNES. It doesnt seem to
have much of a future. Sega have been clever with the 32X,
it means that people can still buy a MegaDrive now even
though Saturn is on the way. Of course, if Saturn is a
success then it would seem stupid to have two 32 bit
consoles, I wouldnt be surprised if 32X never appears -
it might be just a ploy to keep selling MegaDrives until
the Saturn comes.

I'd say that the PSX will kick EVERYONES butt. Of course,
the PSX, 32X and Saturn are all just vapourware right now and
the Jaguar is REAL. However, given Ataris poor marketting and
software development record it might as well be vapourware.

Its all very well saying 'Atari will do well this Christmas'
but the time to do well was LAST Christmas when the Jaguar was
the ONLY new console anywhere in sight and Atari just plain
blew it.

I think its already gone to the great Atari graveyard in the
sky - along with the Atari XL, Lynx and Falcon. After Commodore,
Atari must be the single most inept company I have EVER seen.
The only advantage of Atari is that they didnt have two greedy
senior managers sucking the company dry of money to pay their
2 million dollar a year salaries and to pay for their
corporate jet flights to and from the Bahamas.... You know the
individuals I'm talking about.

Gavan, tell me you don't really mean "PC." I mean, you've got a fast, easy-to-use machine, and you'd rather drop to a PC than to a Mac? Granted the Mac may be a tortoise compared to an Atari or Amiga, but the PC is more like a snail...and a dead one at that. :-) Price/Feature-Performance wise, everything but the high-end Macs easily outstrip the PC (by several hundred dollars, last time I compared them, which was a month or two ago). You wouldn't really switch to clones, would you?

> wouldn't really switch to clones, would you?

If I wanted to use a Mac I'd simply get an EMPLANT card for
my Amiga and I could run all the Mac software I needed. As it is I
use a Mac at work every day and although its OK for the job I do I
can safely say it would be just about the LAST choice for use as a
home computer.

Why? Because:

The system feels so SLOOOOOW - I use a Quadra 650 with 33Mhz 040
and the system 'feels'really sluggish.

The system is frustrating to use - the 'friendly' GUI is just
plain annoying after you've used it for a bit. I'd like to see
a command shell for extra functionality.

The whole ethos of the system is to take away the feel of
using a computer - i WANT to use a 'real' computer. It doesnt have
anything like the sort of easy to use, cheap program development
tools that the Amiga has.

I dont like the Apple company who are just another corporate
IBM wannabe.

The mac lineup changes so often that any Mac I bought would
likely be out of date in a few months.

It's just not a good choice for a home system as far as I'm
concerned.

The PC is pretty crap too, but at least you can build a system
quite cheaply, theres lots of software and shareware and most
importantly it has LINUX which means I could run a complete UNIX

and XWindow system of my own. Oh, and it also has DOOM!

With 80Mhz DX2s now available and the Pentium set to fall
in price , power for pound is still very good with the PC.
Whats the point of spending money on a PowerMac when it
DOESNT EVEN HAVE THE OS WRITTEN IN NATIVE CODE!?

As it is, I'll expand my Amiga a bit more as I can afford to,
and whenever it comes time for a new machine I'll look at the
options. If the Amiga technology contines and we see the much
rumoured AAA chipset, I think thats the platform for me. If not
then the PC looks the most likely - an 80Mhz DX2 with 16 bit
soundcard, doublespeed CDROM, SuperVGA etc etc would be nice.
Of course, I dont think I'd want to spend big money on a
system. With the Amiga I was able to build the system over a
number of years, as I could afford it. If I had the money right
now for a big system I'd rather spend it on a Stereo, holiday,
beer etc.

I think that most Ataro owners will probably also choose
PCs when they outgrow their Ataris (unless Atari make a
spectacular re-entry to the home computer market). They are
just the most logical choice now.

They have over $20 million in spendable money. It is a question of if they
want to spend that much for one big marketing blitz. (They should).

>The Nintendo Saturn is due out soon. Nintendo has such an advantage already,
>Atari is dead is sh*t doesn't start happening REAL soon.

What do you mean soon? It is not going to come out until 1996! This is
1994! That is **NOT*** soon. It will be in arcade games (in some form)
in 1995. Sega's product will be out for the home market sometime in 1995.
That is a much more immediate threat. Also that Sony playstation will be
due out before then.

As far as I know, Geoduel and Cyberdrome were cancelled. However, Eye of the Beholder, in addition to Battlezone 2000 and two other games, *is* completely finished and awaiting production. Atari's official reason for not releasing them is that production takes a lot of energy which they would rather focus on the Jaguar. Their official position is that these games *will* be released, at an unspecified time in the future.

Forgive Scott:

I forgot that you live in a small town. I have had similar experiences while up at school in Oneonta, NY.

I should have rephrased what I said to indicate that such choice usually exists in major metropolitan areas like NYC.

Now, NYC is a disgusting place to live, however, PC parts and prices are really cheap due to the fact that virtually every electronics store sells PC items, etc.

But, the days of the small town "computer dealer" are ending...many can't keep up or compete with Mail Order or Super Stores.

Specialty shops like Toads and Steve's will be around for as long as there are ATari hobbyists - thank God, huh?

Atari Corp. has no reason to release new games when they have no distribution outlets for these games.

Why would they spend time and money for packaging and producing the Lynx game only to sell a few hundred copies via mail-order?

The company will need a major retailer carrying the Lynx before these new games are manufactured. This is why I suggest we concentrate on Toys "R" Us to carry the Lynx and its games.

I don't think a lot of people realize that it is "get into retail stores in 1994" or "become a discontinued model in 1995" for the Lynx.

We must write Toys "R" Us and Atari Corp...

Unfortunately (or fotunately :-)) I read the latest stuff
on the 32X. Yes, it is on the way. November 1994 for the US.
In fact, when I read it I realized that what I said before
was more true than ever: that SEGA has a very nice chance
of taking the whole US market. Of course, internet is not
the US so I don't know about other countries. But the 32x
looks very very promising and I can tell that it will sell
like hell.

I give ATARI until mid-October (yes, I changed a bit
my own deadline) to do something IMPRESSIVE or lose.

I think the letter-writing will do little, to be honest. The real
breakthrough will be when the chains start selling jaguars and have
more games on the shelves. At this point, I'm sure they'd be happy to
put Lynxes and games alongside the other Atari products. Til then, even
Atari isn't pushing the Lynx. Once again, patience seems to be the
operative concept... Those who are impatient, buy Se*a and Nin*endo!

Ari,
Your point was not lost on me. Believe me, I'd love to be
able to go to Software Etc. to buy an Atari program, for example.
However, this is about the only thing missing by owning an Atari
in my area. And anyway I FTP quite a bit of software. Taking a
week to get a program I want is not that big of a deal to me. I
know some people are less patient. Anyway, point taken :-). I
realize in the Big Apple there are more PC stores to choose from
than Sanford, Maine.

Raist,
Why October? Don't you think that you should maybe give Atari until Xmas? This is when most game system sales occur. IMO, Atari's taking plenty of time to plan a spectacular rollout this winter was a smart move. They lost out on summer sales. Big deal! Atari has said that they plan on selling 300,000 Jaguars this year. If they met that mark would they fail? Of course not! 300,000 Jags sold this year in the US would put Atari far past the 3DO in this country. And this is a formidable user base to compete with by Sega, Sony and Nintendo. Next year Atari wants to sell 2 million systems. If they make a strong showing this Christmas season (selling all 300,000 units) then other retail outlets will take notice such as Wal-Mart, Lechmere's (which I heard will get the Jag in August, actually). The Jag will get good floor space in stores and have quite a few great games already on the shelves. No matter how powerful you think Sega is, they will have a hard time crushing Atari. Atari stands in a position to be a major player because they got their system out and games have been developed. It took developers awhile to get up to speed on the Jag- what makes people out there believe that Sega's games system will magically have 20 killer games at release time? If Atari has 20 million to spend on ads this year and release 15 games by Xmas they will have no trouble selling out of Jags. Why not just wait and see?

While it seems very noble for you to get this writing campaign off the ground, and I really like my Lynx, I'm not going to do Atari's marketing for them. If they can't market their products without your help, then they should fail. Even if you were successful and could get the Lynx back in TRU, how long do you think it would be before Atari screwed it up again (and the product just plain didn't sell).

The Jaguar, for example: I have been hearing from the pro-Atari groups on Usenet that it is the greatest machine of all-time and that such-and-such games are comming out for it in a soon (or sometimes, a date is even mentioned). These dates are always wrong (by months, if not years), yet you still have faith that Atari will pull this off. There are suppose to be x amount of games out by Christmas '94. I would be willing to bet the the Jaguar doesn't have 10 games out by Christmas, in a store, where I can actually see them. Atari putting the Lynx on hold is ridiculous. They will

supposedly wait until the Jaguar is successful and use some of the Jaguars profits to get Lynx back out. The Lynx will be thought of as dead and they aren't going to be too successful bringing back a dead product.

Atari lacks the knowledge to make a successful product.

Only members of a small, cult-like pro-Atari group, are going to buy the Jaguar for Cresent Galaxy and Temptest (and whatever else is suppose to be out).

(although, like I mentioned above, the cult of Atari is a very noble cult)

Brad

>Sinclap can't read; only us smart Atarians will ever read this. ;-)

Your comparisons are not fair. Is your Mac running in 2-bit colour like your Mega STe? Is you Mega STe drawing your screen using proportional fonts instead of 8x8 fonts? The standard Mac resolution is 640x480x256 -- since each pixel takes four times as much information to draw as on a 640x200x4 screen, of course redraws will be slower. (There's also the fact that because the resolution on the mac is about twice that of the Mega STe, there are roughly twice as many pixels in a title bar of the same size, thus it takes longer to draw it.)

The fairest comparison would be to compare redraw speeds of the Mega STe at 640x400x1 and the Mac at 640x480x1, with both using proportional fonts.

I can't comment on the Amiga since I have never used one -- I have experience
only with the Mac and the Atari.

About the OS -- I have to disagree. This is probably going to end up
turning into another CLI vs. GUI debate thread if we continue this, so let me
just say that CLIs and GUIs both have their strong points, but that IMHO
a well-done GUI is far more easy to use and much more versatile than any CLI.
If you are referring to the speed of the actual code of System 7, I can't
really comment on that -- I don't know how efficient the code is. I can only
state that System 7 seems pretty zippy to me, and that System 7.5 is reputed to
be even faster.

Bi

> 4mb enough to run two applications - you cant be serious!!!!

I am very serious. If you remove unneccesary extensions and control panels
(Closeview is a good example. It hogs 350K!) you can get your memory usage
to a very reasonable number. My System uses only 1300K. With 4Mb of memory,
that is enough to run two medium-sized applications. Right now I have
ClarisWorks, JPEGView, Soundtrecker, Stuffit Lite, and the Finder running.
That's four major applications, and I still have 3Mb free on my 8Mb machine.

>On the Mac I use there is 8mb and you can just about run two medium apps
>at once. Actually, its not very good at running them simultaneously
>since the so called 'multitasking' is so pathetic. Having two tasks in
>memory at once would be a better way to describe it.

Have you ever used a Mac for more than five minutes? Can we try to keep
this discussion reasonable, please?

> One of the big problems is that the Mac DOESNT have dynamic memory
>allocation so programs grab a big chunk of ram whether they need it or
>not and if they find they need more ram than they grabbed, well, tough.

I will not argue with this. There are commercial programs that can work around
this, but it really should be incorporated into the next System.

>It's frankly incredible that a supposedly modern OS can be as clunky

I would rather have the four slot box with Power PDS card than the PowerMac
6100. The Mac 630 series are truly Multimedia machines with the optional low
cost cards. These will be hot sellers.

>
> And the 680xx is just that cheap because Apple want's to sell them all out.

Apple does not stockpile cpu chips. Apple uses just in time inventory. The
Mac 630's with its expansion capabilities and low price is a better buy than a
PowerMac 6100. There is a PowerMac PC pds card for it.

No, I have not currently used any Atari aplications. I don't know anyone who
still uses an Atari. I can say this as a fact that no Atari can match
Apple's current offering in terms of price/performance/software. The New Mac
630's as with Apple's other offerings put the $1300 Falcon to shame.

Very poor marketing? Selling millions of units a year! Dead machine? The
Mac 630's are PowerPC upgradeable and works with the PowerPC PDS card. And in
four years most users will have upgraded their LC and Quadra series to PowerPC
upgrades. At least Apple provides upgrade options, where as Atari wants you to
ditch their computer line to upgrade to the Jagflop. There will be plenty of
680X0 software in the comming years for users who do not upgrade.

There are tens of millions of 286 and 386 machines still in use with not
upgrade options. Will these users defect to the Mac? Some well, but most will
not. As for Atari users, your fate has been sealed...

Scott, when you are using applications like making some math
calcs, etc. the 68040 Mac will stomp on the 16Mhz 16-bit 68030
data path Falcon. I don't think that's even remotely arguable.

Poor marketting in that people look at a product line that changes every
four to six months and think "boy, what's wrong with them? They must be
having real problems!" And PC brainwashed magazines and newspapers support
that attitude. Apple should either liscence their OS, or pick several
different configurations (Q610, 650, 800, AV, PPC) and stick with them for,
say, three quarters of a year, changing prices but not systems, then come
out with significant changes in product lines. These frequent and small
changes have confused a lot of potential Mac buyers.

>There are tens of millions of 286 and 386 machines still in use with not

I'd like to see these PC users upgrade to Mac rather than PC, but with PCs
holding most of the bussiness market, IBM nudging Apple out of the
education market (if you don't believe me, I can name several *big* school
systems that are replacing Macs with IBMs), and Apple doing only slightly
better than Atari on marketing (TV commercials, anyone?), I don't see Apple
grabbing many of these PC upgraders.

Sorry, Peter, I didn't mean to imply that your information was missleading
or unwelcome. Your method of presentation ("HA! Look how much better Mac
is than Atari! What a peice of sh*t that Falcon thing is!") is what I, and
most people object to. Most of us are aware of the advantages and
disadvantages of both Mac and Atari, and we don't need or want you slinging
insults in an attempt to convince us we should have a Mac. I also don't
think Apple would appreciate your less than polite method, either.

Regards,
Tom

this is really, really, really, sad. as in lame. i like my lynx, but what exactly is the point? do some math--let's say there are a thousand people out there who buy a new $40 lynx title. that would not cover bringing a game to market. atari, toys r us, etc are not stupid--they are in the business of making money. and the lynx is not going to start making money for anyone. atari is selling off the current stock of games because they want the cash; if they ever run out of a title it's not going to be coming back. sad but true. there are no lynx units in production, there are no cartridges. i don't like it, but it's real. face it.

>cost cards. These will be hot sellers.

sorry this option is crap, cause if you want true multimedia one should have
a fast memory... Anyway the Power 6100 has the better design.
The biggest disadvantage of this machines is the OS (from the developer side
of view not user side)...

>Apple does not stockpile cpu chips. Apple uses just in time inventory.
oh realy... I don't think so. They order batches of production runs and sell
then... And I think they should sell PowerPC Mac's...

I'm lucky then I guess, I know about 10 people personally who use a variety of ST/TT/Falcon machines for everything from playing games to publishing magazines. Now you have confirmed what we have all suspected for some time ie you have no idea of the capabilities of Atari software, would you please confirm it cannot be a *fact* that Mac software is superior to Atari software in every way? If you actually sat down with something like a TT with a 50Mhz 68030 card, a 24bit high speed GFX card and some of the heavyweight Atari graphics or DTP software or even Music software, you may ge a hell of s surprise ie the Mac isn't the ultimate after all. While I will concede a killer TT isn't cheap, the software to run on it, is generally cheaper than Mac and of a higher calibre than you suspect.

Maybe you havent used a computer with a well designed, compact
OS before. You may well find that system 7 is fast but I am used to
running an efficient system and I find it annoyingly slow, even on
a 33Mhz 040 Mac. I dread to think what it would be like under
emulation on a PowerMac.

You might say that the Mac is running a higher rez screen etc
etc. But consider this, next to the Mac is an ICL PC. This is course
runs Windows/DOS so you might expect it to be even slower. Not so:

Mac : 33Mhz 040 PC: 66Mhz 486
SCSI HD IDE HD
800x600x256 1024x768x256

The Mac SHOULD outperform the PC on most tasks but the PC simply
BLOWS IT AWAY on everything - program speed, disk access, graphics
manipulation speed. The fact that the Mac loses out against a machine
with an IDE disk, higher rez graphics and Windoze shows just how
poor the system is.

> > 4mb enough to run two applications - you cant be serious!!!!

I'd hardly count the Finder as an application - its an essential
part of the OS. Try running Microsoft Word and Mac draw and doing
anything useful on your machine.

> >On the Mac I use there is 8mb and you can just about run two medium apps
> >at once. Actually, its not very good at running them simultaneously
> >since the so called 'multitasking' is so pathetic. Having two tasks in

> Have you ever used a Mac for more than five minutes? Can we try to keep
> this discussion reasonable, please?

yes i have - I'M USING IT RIGHT NOW TO TYPE THIS (via MacX). The
multitasking is PATHETIC. Try running a couple of programs at once
and (if you are doing something with both programs) the screen output
is dreadful, especially in the non-active window. On my Amiga I can
happily multitask away with much smoother results. I'd imagine that
the Falcon can do likewise. The Mac DOESNT HAVE PRE-EMPTIVE
multitasking - _thats_ why its multitasking performance is so
awful. The system works OK as a task sharer, but thats IT.

> >It's frankly incredible that a supposedly modern OS can be as clunky
> >and slow as System 7.

> System 7 is not clunky and slow.

No dynamic memory allocation and no premptive multitasking - clunky.
Slow, well I suppose if you're used to using Macs then you'll think
its fine but if you've used PCs or Amigas (or probably Falcons too) then
you'll most likely be very dissapointed with the performace penalty imposed
by the system. It actually seems to be worse than Windows and thats
saying something.

> > On my Amiga with 6mb of memory I can happily multitask 3 or 4 medium sized apps,
> >or even 10+ smaller ones with great efficiency.

> Wow, I'm doing that right now!

You've bought an Amiga?

Ok, now this is a reason to buy a computer, because it's the best
platform to run a favorite application.

> With 80Mhz DX2s now available and the Pentium set to fall

Who cares? There's been a lot of meaningless debate on this issue, but
the bottom line is that the PwerMac is faster than 68k Macs. And it's
compatible with virtually all existing 68k software.

> As it is, I'll expand my Amiga a bit more as I can afford to,

> beer etc.

PC architecture is beginning to look rather dated. Power PC technology
is moving rapidly towards the point where you buy a box, pick your OS
(OS/2, windows, mac/os), and load up your applications. If (and I
admit this is a very large if) IBM can make the PPC transition as
smooth as Apple has made it, Intel based systems will have the same
future as the amiga.

I know I am inviting a lot of flames but I have to say this!
I own an ST and browse through Atari groups once in a while because of that.
I am amazed at the way some people seem to think on these groups, in some letters one can see an almost religous feeling about Atari and their products.
I think a computer is a tool and sometimes a Toy, that's that. If a toy becomes outdated you discard it, if the manufacturer does not want to make bags for your outdated vaccleaner, you buy a new one. So what is all this fuss?
The ST was a good machine but it is outdated, the Falcon was Dead On Arrival. It was over priced comparing to the competetion(don't lecture me on how fabulous DSP and 24-bit sound is. I and %80 procent of people who use a computer don't need the bloody things, we want a decent computer with a fast processor with a nice price tag). Atari made a nitch nachine and went and handicaped it their usual incompetence in production and distribution.
The same is true about lynx, it is a dead product. No amount of letter writing will bring it back to life, do you know why?
Because no major software houses support it, and by the time that your letter writing makes the retailers carry it(fat chance) and enough are sold that the software houses are interested it will be totally obsolete.
Now the Jaguar has a chance, if the incompetence of Atari does not cripple it and sadly this is the most likely thing to happen!
I for my part will wait quite a while before I buy anything with an Atari logo on it, simply because the company has proved itself untrustworthy.
Pity it was Commodore and not atari who filed for bankrupcy and will end up having a new owner.
So give up people and get a life instead of praying to the Fuji-logo.

It is actually fairly fast on a PPC. We like the features of system 7.
The original DOS was well designed and compact. It ran in less than 1K of
RAM and was all hand-coded machine language. I am still awed by the design;
it leaves almost no room for improvement from a coding point of view.

The PC used in this comparison is faster than the mac. How big is the PC
drive compared to the mac drive? What video card does the PC/MAC have?
What software where you comparing?

> I'd hardly count the Finder as an application - its an essential

Yes, system 7 multitasking is very poor. But you previously compared it to windows. You are saying: look how much faster my PC is and look how much better my amiga multitasks. You are comparing it to the advantages of two different platforms. That's like saying: look how much faster my cray is and look at the price of my 486sx25.

> No dynamic memory allocation and no premptive multitasking - clunky.
>Slow, well I suppose if you're used to using Macs then you'll think

Yes, yes, yes, bad multitasking and bad memory allocation. PCs that are not using NeXTStep, OS/2 and linux do not multitask better than the mac.

> You've bought an Amiga?

That's kindof funning. Both the joke and buying a dead platform.

You're comparing a 33MHz 040 to a 66MHz 486. That's not fair.

I didn't include the Finder in my list -- there were four applications PLUS
the Finder. The fact is, 4Mb is enough to run two medium-sized applications
comfortably.

>the Falcon can do likewise. The Mac DOESNT HAVE PRE-EMPTIVE

>That's four major applications, and I still have 3Mb free on my 8Mb machine.

You are taking a simple example. These are all very small programs. You
can not even load FoxPro into a 4 MB mac. There are lots of Mac apps,
(even word processors, spreadsheets, etc) that take up 2 or more MB each.
At 1300K, your system is very stripped down. Typically System 7 takes up
1200 to 2800 KB. In my experience most users have about a 2MB system.

>>On the Mac I use there is 8mb and you can just about run two medium apps

>Have you ever used a Mac for more than five minutes? Can we try to keep
>this discussion reasonable, please?

I think you are just attacking Gavan here because you don't have anything
reasonable to say. The multitasking IS fairly pathetic. His statement
about 2 medium apps is overstated: in 8 MB you can run 2 large apps or
4+ medium apps, but it seems like you are the one who doesn't have a reasonable
understanding of the Mac here.

I often have trouble runing two applications on my 8MB mac. I would
however classify any app taking up more than 3MB "large" not medium.

>>It's frankly incredible that a supposedly modern OS can be as clunky
>>and slow as System 7.
>
>System 7 is not clunky and slow.

This is a metter of opinion obviously. I like using System 7 (usually,
it also has a lot of limitations). But it is very large for what it does,
and it is fairly slow. Of course on a Quadra (any variety), it runs
fairly fast. That is because of the horsepower of the 040. I often
feel my 33MHz 030 Mac is way to slow for the processor it has.

I knew I could not resist to respond for long. This morning, Apple posted their third fiscal quarter earnings of $138.1 million versus a loss of $188 million a year ago and sales increased to $2.15 billion versus $1.8 billion a year ago.

Apple shipped over 200,000 PowerMacs in the quarter(much more than the Jagflop). And sales of the new PowerBOOK 5XX SERIES are strong.

As noted: Drake University in Des Moines Iowa is currently Apple's largest PowerMac customer. Two weeks ago, Drake took custody of over 1,100 PowerMac 7100's. These Macs will replace the older ones in each of the dorm rooms as well as administartive offices. It was a pretty site to open the Des Moines Register to look at a picture of stacks of PowerMacs.

Most Mac's have DRAM-based video.

And in 4 megs, you can comfortably run 10 progams at once, and you can actualyl run them fast if you're using Geneva.

In article <30i2js$pi7@msuinfo.cl.msu.edu>, hopper_t@msupa.pa.msu.edu writes:

Anything without the AV label is going to lack a DSP. For anything less than pure number crunching, the Mac w/fpu is going to be about the same speed as a Falcon w/fpu, and in some cases (screen redraw vs. NVDI, for instance), the Mac will actually be quite a bit slower. My MSTE4 (16MHz 68000 w/cache) with Warp9 does screen redraws (windows open/close, scrolling, etc.) faster than a 25MHz 68040 Mac (Q610 or Q605). Too bad Sinclap can't read; only us smart Atarians will ever read this. ;-)
==========
Yes, but your redraws will be in ST high, which is 640x400x1. Most Macs run in a 640x480x8 (256 colors vs b&w) and therefore push out 8 times the video informaiton. Now most Quadra owners run their machines in 16 bit mode (what the Falcon calls True Color -- but it ain't-- that's 24 bit) which is 16 times the video information. So what you've got is "Atari: does *less* work faster." It is possible to run Macs in 1 bit mode, but most people don't because 8 bit is nicer looking and at tolerable speed. 8 bit mode on a Falcon, though, is perceptibly slow.

> They have over $20 million in spendable money. It is a question of if they
>want to spend that much for one big marketing blitz. (They should).

They have somewhere in the neighborhood of $35 in cash and marketable
securities to run the WHOLE SHOW. I highly doubt that they will spend
60% of it on advertising and marketing. It's not a matter of that they don't
want to, rather its that they can't as there are other expensives involved
in running a company.

They better get in gear fast - the X-mas season isn't too far away and many
major media such as magazines and TV commericals have long lead times and
production schedules, etc. This type of stuff can't be done overnight to
be effective.

Ooops - I meant $35 million (see above).

So what if the SEGA and NINTENDO machines aren't due our for another year?
If Atari blows X-mas, they are done for!

I hate to agree with the "non-Atarians" in the audience, but I was never pleased with the Falcon's performance considering what it cost.

Now, when running standard ST apps, it ran them very well. However, all it really performs like is a super-STe. Most apps that require 256 and TC modes are slow as sh*t.

It still is (was) a good machine for the feature set - lots of ports, very good compatibility, excellent sound and gfx hardware, great OS front-end. However, it was priced $600 too high and too much of the promised software turned out to be vaporware.

As a result, I sold it and I'm happier even running DOS.

If someone ever made a PC-DOS shell that looked and worked like TOS 2.x and TOS 4.x, PCs wouldn't get such a bad rap...

You should have bought an Amiga 1200, then, no SCSI, no DSP, no 16bit-Sound,
etc., but programmable video output an much cheaper. It was YOUR decision to
buy a Falcon, as it was mine. I changed my mind due to the serious I/O
problems my Falcon had ('device not responding' errors in HC mode all the
time (SCSI drive, tower case). I still wonder whether AHDI 6 or the hard-
ware was faulty).
So I got myself a TT, for this machine gives me - fairly fast JPEG decoding
- good comms package
- neat UUCP package
- good TeX version
- fast video output
- SCSI
also.

>Now, when running standard ST apps, it ran them very well. However, all it
>really performs like is a super-STe. Most apps that require 256 and TC modes
>are slow as sh*t.

A software problem. Get NVDI 2.5 and a registered (DSP-JEGging) version of
GEM-View (or any other software that uses the DSP for this task).

>It still is (was) a good machine for the feature set - lots of ports,
>very good compatibility, excellent sound and gfx hardware, great OS front-end.
>However, it was priced $600 too high and too much of the promised software
>turned out to be vaporware.

Well, most of the software already existed before the Falcon came out, many
programs have been expanded since, plus there are the Falcon only versions
of Cubase Audio etc.. What'd you expect? Lots of games? The machine was/is
too expensive to be successful in that market, and the ST already had lost
against the Amiga in the early 90s, just as the Amiga loses against the
clones now. I'd agree that the Falcon was overpriced soewhat, but not
$600!

[DOS]
I'd throw out DOS and use OS/2, but in that case I'd - need an ATI gfx board
- need 8 megs of RAM.
And I also want SCSI, not that crappy IDE -> PCI board or Adaptec 1542C

My TT (32 MHz 030, 32MHz 882) runs in 800x608x32K with the board mentioned above and NVDI 2.12. I use a heavily modified TOS with real-time redraws during window movements/sizing and slider actions. And all this is real fast.

>So what you've got is "Atari:
>does *less* work faster."

Yes, of course, as with my TT, right? 'Less' work, indeed.

>8
>bit mode on a Falcon, though, is perceptibly slow.

Nope. The VDI output is slow. Run NVDI 2.5 instead of the original output routines, and the Falcon will be noticeably faster than LC macs.

No, it wasn't my choice to buy the Falcon. I acquired my Falcon in lieu of
owed to me due to a contract settlement I had made with an unnamed
ST software developer who couldn't pay me what they owed.

I already had an STe w/lots of software so I figured I'd accept the Falcon
system that was offered to me. They had made promises of getting into Jag
development and at the time - alot of Falcon specific software was supposed
to be coming out.

What I found was that there was very little Falcon specific software available.
The few apps that were tended to be very expensive or require a VGA display
that I could not afford.

I never had any I/O errors with it though...

One should not need to resort to add ons like NVDI and WARP-9 to make a
$1200 computer run video at a decent speed!

==========

I was just saying that comparing i bit video and 8 bit video is comparing apples and oranges.
As far as the Falcon goes, the video *is* slow. I agree that the video on an LC or LCII is also slow.

As far as the TT goes, it was a good price/performance value when it was brought out, but it is no longer. I use TTs at work managing databases, and they *are* pretty speedy. However, they are not as speedy as the average hi-end (486DX2/66 or 040 33MHz) DOS or Mac system. I haven't said that anything is junk, but that one can't say 'my Mega STE is faster than a PPC for video" when the PPC is doing 16 or 24 bit an the Mega is doing 1 bit. I am aware that the TT's video can be enhanced via the Crazy Dots or Cyrel cards. However, it is unfair to compare DOS or Mac average onboard video with a specialized add on card. Here in the states, Crazy Dots II costs about $700 and CyrelSunrise costs >$1000, which is too much for what you get.

Yes, they did release it. If you haven't noticed, that's how many of the major software houses do business. Small comapnies typically do the actual development work and the major house does the publication and marketing for the product. This saves on costs, etc.

It's really a shame that such an excellent program as Delixe Paint stayed at version 1. I guess Artistech developement, the actual authors, didn't make as much money as they thought they could on the program.

However, from what I heard, the program actually sold quite well in Europe where it had become the standard gfx package for serious artists and game developers.

IF Deluxe Paint came out in a 256 color version for the Falcon, I would have kept that machine and not switched over to a DOS box. DP was the best gfx package I've ever used on any machine! It was a work of art.

Sure, it had several bugs, but it was amazing! I should know, I drew several thousand sprites and static screen images with it...

PCs are a good choice for general purpose computing. As Gavan has said they have the software base and the hardware is dirt cheap.

There are other reasons I have moved over to a PC from my Atari as well. I need to be compatible with the clones both at school and at the corporation where I will *most* likely be working upon graduation.

Also, Atari owners will move over to a PC because of the existence of the fine GEMULATOR emulator and because DOS is so similar to TOS at the file and disk level that many users can easily exchange their data and adopt to the similar OS conventions, whether as programmers or as users.

Atari not only "borrowed" the PC disk format, it took many of the DOS functions (and function numbers) as well...

Macs are pretty and they have good software, but I still don't like them...

```
CAIN Atari Fun Fest 94
----------------------

CLEVELAND, OHIO is within 500 miles of half the population in the United States
and a very LARGE population of Canada. It is a great place for an Atari Show
because most people aren't too far away!

The CAIN Atari Fun Fest 94 will be held in Kirtland, Ohio (very close to
Cleveland) and will allow Lynx and Jaguar owners to have a lot of fun!
There will even be a "Cleveland Lynx-Up" where Lynx owners can bring their
Lynx and game cards and comlynx with other players! Who says that you'll never
get the opportunity to comlynx???

Jaguars will be there to play and you might be lucky enough to take one
home with you (courtesy of Atari Corporation).

There will also be dealerships attending this show that will be more than
happy go give you great deals on game systems and game cartridges!

If you are an Atari computer gaming fanatic, not to worry! There will dealers
there to supply you with all your computer gaming needs...

Dealers:

If you are interested in selling your Atari merchandise, this is a fantastic
opportunity for you to do so! But you must register now! The tables are
being sold quickly! Contact the show organizers immediately!

User Groups:

Several tables have been set aside for user groups! If you are interested
in representing your user group, contact the show organizers! Since
user group tables are FREE, the user group tables are going quick so don't
delay or there may not be any tables left!

PLEASE distribute this on BBSs, networks, and at your user group meetings!
We want to have one heck of a gaming day! And a gaming day that might be
closer to you than you think!

CAIN Atari Fun Fest 94
----------------------

Central Atari Information Network
Presents
C.A.I.N. Atari Fun Fest 94
August 7, 1994 / 10:00AM to 5:00PM
Knights of Columbus Hall
```

7637 Chardon Road
Kirtland, OH 44094

^
* THE FIRST CLEVELAND-AREA ATARI SHOW IN YEARS!!! *
^

Free Admission!

What to See and Do!

The New Jaguar Game System!
Win a New Jaguar Game System from Atari Corporation!
The LYNX handheld game unit
Bring your LYNX and games to COMLYNX with other players!
The Falcon Multimedia computer
Gemulator (IBM emulator running Atari ST Software)
8-bit computers and products
16/32-bit computers and products
Portfolio palmtop computer
Meet the editors of C.A.I.N.
Classic game systems 2600/5200/7800 and games
Catalogs and brochures for Atari line of products
Atari products for sale / Plus Much More!

Table pricing per 8 foot table
$10.00 per table no electricity
$15.00 per table with one outlet

Good program, but they're hopeless in supporting it. I sent
my registration card away; and later when I had a problem with parts
of the program I tried to get in contact with them and their Australian
distributor, I didn't get any reply whatsoever. As a result, I'm in
a bit of bad mood with EA(and that's saying it nicely).
If they can't even help someone who forked out the dosh for
one of their programs, what good are they?

Hamo

P.S. DPaint ST was written by Artistech Developments, a bunch of
guys who were staunch Atari supporters, not by EA.

It's NOT meaningless debate. The fact is that since Apple can't even
ship their OS in native code (a) ALL programs run a lot slower than they
need to and (b) The chances of other companies producing lots of
native code software can't be great if the manufacturer hasn't.

PowerMac advocactes seem to think that there is going to be a
rapid transition to native software - I don't think so. Why? because
there aren't a lot of development tools for generating PPC code.
Furthermore, many of the packages on the Mac will have been developed
with specific compilers and development systems, and porting them
across to a different system that does native code will take TIME.
Why do you think Apple don't have the OS native?

> Don't hold your breath waiting for further computer developments from
> eithaer atari or amiga.

I'm not. But the system I have right now meets my needs and I can
expand it a little further yet. When I reach the limits I'll probably
have to shift platforms. It's (just) possible we might yet see a AAA
machine so _if_ there's one about it'll probably be a strong
candidate for my cash.

> admit this is a very large if) IBM can make the PPC transition as
> smooth as Apple has made it, Intel based systems will have the same
> future as the amiga.

PC architecture has been dated for the last 8 or 9 years. Right from
day one the Amiga left it for dead. But since the platform is so
popular there has been a lot of development work done on it and it
still remains the most cost effective system for the money. It may
not have a great architecture but speed and costwise it delivers the

goods with a vast range of software able to take advantage of its power - unlike the PPC chip.

With really powerful PPC chips, it might be possible to just pick your OS and load your applications but with the current batch (and especially the 'affordable' 601) the performance of Intel and M68k software just does not justify the price tag of the machine. Fact: The powerpc is slower at running Mac software than existing machines that can be bought at the same price and the PC performance is pretty abysmal. You need 16 megs just to run the emulator and it cant even do a 386 which is disastrous for most modern software. The speed is very poor too. So when you buy a powermac you get a machine with lots of (so far) unfulfilled potential and the capabilities of a fast 020 and medium speed 286, not a great deal.

What pisses me off is the slick apple advertising campaign which implies that the PowerPc machines will be able to run all your existing PC and Mac software even better than you already do, which is just a blatant lie.

Then why is it so SLOW? When Jim drew was pissing around with
disassembling the OS when he was doing the Emplant card for the
Amiga, he commented on how poor the coding efficiency was in the
Mac OS. He remarked that the OS had to run thru' about 40K of
code every time it context switched,compared to about 800 bytes
or so on the Amiga. I can only assume that the OS has bloated out
with time and new revisions. On my Mac at work, the OS takes 4 megs
of user memory which is ridiculous. Even getting rid of a few
lesser used functions, the best we can do is 3 megs. ugh!

> What software where you comparing?

Damn right its faster! And it would cost about the same to but both
systems on the market. Which is faster, which has more software? The PC
of course. Thats why the Mac stands NO chance of capturing the business
market. The PC had a nice hi-res card with Windows acceleration, sure,
so how many accelerated cards does the Mac have and how much extra
do they cost on top of the basic config which already costs as much
as the PC with the card. BTW. The mac had a 160meg SCSI drive, the PC
a 200 meg IDE drive. The macs SCSI implementation must be AWFUL for it
to be beaten so easily by an IDE drive.

The fact is that the PC delivers better performance, on more software,
for the same price. The powermac actually delivers WORSE peformance on
existing software, and there aint a lot of native software available -
not even the OS! ha ha!

> Yes, yes, yes, bad multitasking and bad memory allocation. PCs that are not
> using NeXTStep, OS/2 and linux do not multitask better than the mac.

Yes, but PCs _CAN_ run Nextstep et al. With the Mac you have to run
System 7. (maybe BSD soon). People slag off OS/2 for its memory requirements
but compared to System 7 it looks like a very good proposition indeed.

It's out with 256 colour support for the Amiga in the form of
Dpaint 4.5 AGA. Unfortunately, the days when it was an efficient,
tightly coded piece of software have gone. After version 3 on the
Amiga (which would be roughly equivalent to the ST version?) the
cding was taken over by different people and the program is
starting to look a little like PC 'bloatware'. Its still quite
powerful though. Programs like 'Brilliance' have taken over from
it on the Amiga now. AFAIK there is still no decent Bitmap paint
package on the PC. Having done some Windows programming, that doesnt
suprise me.

"Cheap" being in terms of price and in terms of quality and support;
compare machines that have Apple's quality and support (Comaq is very
similar), and you see that low- and middle-end Macs run the same price or
cheaper (considering built in 8-bit stereo sound support, networking, etc.)
than the IBM clones.

>I need to be compatible with the clones both at school and at the corporation
>where I will *most* likely be working upon graduation.

This, Ari, is the best reason I have yet seen on the 'net for buying a PC;
it is also the main reason I get from customers for buying them. Most
people like the ease of use of a Mac better, but many need 100%
compatibility with their workplace.

>Also, Atari owners will move over to a PC because of the existence of the
>fine GEMULATOR emulator and because DOS is so similar to TOS at the
>file and disk level that many users can easily exchange their data and
>adopt to the similar OS conventions, whether as programmers or as users.

This will not be true within the year; Microsoft is replacing DOS/Windows
with a new OS that, from what I've read, will be almost identical to
System 7. It will, supposedly, be backwardly compatible with current
DOS/Windows, but for an Atari user that just means being able to transfer
your files, which you can do to either Mac or IBM anyway. It will be
interesting to see how all of this develops. BTW, I've read that upgrading
will cost in the neighborhood of US$500. No doubt that will drop quickly.

Yeah, I know - they also went on to write Brilliance on the Amiga -
much better than DPaint, and felt incredibly like DPaint ST (Except
it had all the options that DPaint ST and Amiga should have had.

NetBSD has been ported to the Mac here at Virginia Tech. It's
called MacBSD. It will currently run on any 32-bit 68020 and
68030-based Macs (SE/30, Mac II, LCIII, etc.) as the 68040 does some
weird things with memory management they're trying to get around. If you
want more information, try http://acm.vt.edu/. They've a section devoted
to MacBSD.

I never said that System 7 was fast or memory efficient. I'm saying that
the efficiency loss is worth the features of System 7.

> Damn right its faster! And it would cost about the same to but both

You are comparing a high-end clone with a mid-end mac. The PC has a
video card that would probably cost you $400 for your mac. The PC has
a larger hard disk and (generally) the larger the faster.

> The fact is that the PC delivers better performance, on more software,
>for the same price. The powermac actually delivers WORSE peformance on
>existing software, and there aint a lot of native software available -
>not even the OS! ha ha!

There are over one-hundred native commercial applicationds for the powermac.
Emulation is just a bridge until all the software used on a system is native.

WP: Word Perfect, Nisus Writer, Star Writer, Claris Works
DTP: Page Maker
VIDEO: Video Fusion, Premier, Morph
MODELLING: Stratavision, Mini-CAD, Archi-CAD
DRAWING: Photoshop
GAMES: Flying Nightmare, Pathways Into Darkness

This is about 10% of the software shipping for the PowerMac and they could
make for a very usable system by themselves.

> Yes, but PCs _CAN_ run Nextstep et al. With the Mac you have to run

Yes, you can run Nextstep. But it'll cost you $1000 more dollars and
destroy that application support that you covet. OS/2 does not offer
as good an interface as the mac, it lacks application support and
it is missing some features.

Thats the whole point. I am sure there are some nice apps on the ST and TT
line, but are these machines still being sold today? The Falcon is way over
priced as well as underpowered. Next week, Performa 630's will be arriving at
the local consumer outlets. Aperforma 630 with monitor, keyboard, modem and a
software bundle(Clarisworks, Quicken and many other titles) can be had for
$1500 for the 4/250 config. Take the price difference between a Falcon(TT too)
and a Q605 or630 and the Mac will be cheaper by hundreds of dollars as well as
having a software bundle. Mac software in amny cases is cheaper as well as the
same as Atari prices if available.

: You're comparing a 33MHz 040 to a 66MHz 486. That's not fair.

It's fair. On anything except a Mac, the two above processors would run at about the same speed. Per clock-cycle, the 68040 does twice as much as a 486. However, since you're talking about a Mac, the speed of the 040 is reduced to less than 1/4, so perhaps may not be fair.

Apple ported the most-used portions of the OS to native code. The fact is there is a great deal of code which will in fact result in slower performance if ported to PowerPC native code, because of the great deal of 68K software still out there. If you're running a 68K program and the portion of the OS you call is native, the context switch can result in slower performance than if that portion of the OS had been left in 68K code.

> and (b) The chances of other companies producing lots of

>there aren't a lot of development tools for generating PPC code.

According to Apple, there are now 200 pieces of native software out there, many of them big name software.

>Furthermore, many of the packages on the Mac will have been developed
>with specific compilers and development systems, and porting them
>across to a different system that does native code will take TIME.
>Why do you think Apple don't have the OS native?

There's the reason I gave above, of course, and also the reason that they'd probably rather work on making the next major revision of the OS all native than porting code which will soon be obsolete, anyway.

: : or so on the Amiga. I can only assume that the OS has bloated out
: : with time and new revisions. On my Mac at work, the OS takes 4 megs
: : of user memory which is ridiculous. Even getting rid of a few
: : lesser used functions, the best we can do is 3 megs. ugh!

: When Dave Small did the coding for Spectre GCR, he discovered
: that the original source code was written in Pascal. The reason that
: Spectre give about 30% more performance than a Mac Plus (which is
: comparable) is that he wrote it in C. I could, of course, be wrong.

Dave did not rewrite any of the Mac's OS. He did make patches to the ROM
so that the system would run with the Atari's hardware, but otherwise,
the majority of the system runs unmodified.

The reason the emulator runs to much faster (and more reliable too) is
the fact that the CPU is slightly faster (8mhz as opposed to 7.8mhz), but
even more significant is the far superior I/O structure of the Atari.
The Mac did (and for the most part still does) run all it's I/O through
the CPU. In the older Mac's even disk I/O was interrupt driven, rather
than DMA. The CPU in a Mac is massively slowed down by all the hardware
servicing it has to do constantly.

3057. Groups going to CAIN Atari Fun Fest 94 get map from me

If you are attending the CAIN Atari Fun Fest 94 in a group (four or more people) then please send me your name and address and I will send you a flyer about the show and a Cleveland Area map and information on how to get to the show exactly.

If you are a member of a user group and believe that your user group members may be interested in attending this show, please contact me and I'll arrange to send you flyers and a Cleveland area map.

Please only request this information if you will be able to give these flyers and maps away to people interested in the show BEFORE the show. There is no use having a bunch of flyers with nobody to give them to!

Thank you.

Sorry to have to tell you but a 66MHz PC is no longer 'high-end'.
Now a Pentium 90 which would be approx 2.5x faster again than this
PC, _would_ be high end. Oh, and of course you can also get 486s
in 80 and 100 Mhz flavours. Not to mention 60, 66, 90 and soon 100Mhz
Pentiums.
66Mhz is fast becoming the entry standard for PCs,
with 80Mhz chips at the same price coming from AMD and Cyrix. As
far as 68k based macs go, the only faster chip than the 33Mhz 040
is the 40Mhz 040 found in top-end Quadras and Centris'. Oh, and of
course theres the PowerMacs which run your existing software slower
than my 33Mhz Quadra of course.... So the Mac I have on my desk is
near the top of mainstream Mac performance whereas the PC is way
down the league.

The HD in the PC is only 40 megs larger, and of course is IDE,
so it should be slower than the SCSI model in the mac.

I don't see an OS in that list... strange ;-)

And Atari and Amiga owners get laughed at when they cite a small
range of software! I don't see too much of this software advertised
and whats more, if you have downgraded to a PowerMac can you get
the native version of your existing apps (where a native version
actually exists that is) for just an upgrade fee or do you have
to splash out for a whole new package. BTW, are you saying that
all these apps are now 100% native? I heard that photoshop for
example has native drop in modules, but is still predominantly
68k code.

Now I've heard it all. System 7 is better than nextstep and OS/2..
Why? 'Because its on a Mac and I have one so it must be better than
all other operating systems...'

I'm interested in the Mac version of NextStep you mention. I used
it on the original NextCube and thought it to be one of the best
OS' I'd ever seen. Since the cube only had an 030 and still gave
good performance it should be able to deliver on the potential
of an 040 (unlike system 7). How much does it cost? Can you get an
educational discount?

What? PowerPc code run slower than 68k code? Apple never mentioned
that in their slick advertising campaign.....

> According to Apple, there are now 200 pieces of native software out there,

And according to the Magazine adverts theres very little. Apple
promised a lot of native software but haven't delivered. Take a look
at advertisers lists and see how many are shipping the '200 native apps'

> >across to a different system that does native code will take TIME.

Oh, with all these 200 applications and the 'fact' that 'most Mac
software will be ported withing the next year or so` I shouldn't
think you'd NEED to worry about supporting 68k code.

System 7 is obsolete NOW, it doesn't need another OS revision
to make it look like the shoddy piece of work it is. Still, as
long as apple can continue to service the technically illiterate
section of the market I suppose they can get away with pushing
2nd rate OS' and hyping the PowerMac.

I'm surprised they haven't done a Falcon version of Brilliance -
the machines have quite similar capabilities and a port should
be pretty simple.

There are no standards on a PC. It might becoming more common, but
one of the big problems with the PC is that something that is common(ish)
does not make it standard.

I remember someone going on about how 24bit colour was the effective
``standard'' for PCs as it was so cheap. It isn't (of course) but just
as Mac users over estimate ease of use, so PC users under estimate the
the cost of their hardware.

Oh come on. All this is shortism. A new chip will take time to get
the native code, and in the mean time it still manages to run
a lot of existing software.

The reason PCs are such massive kludges is that there was never a break
in the line when the technology was significantly upgraded. Backwards
compatability was maintained at a hardware level when software emulation
would have been a good interim step.

Yeah :-/ that was a daft point. However, note, Ataris have loads of OSes
to choose from---so there is one reason (at least) to choose an Atari.

Yes, on my Amiga too there is nearly all your memory free for
use. I 'lose' about 100K of chip and 250K of fastRAM when I
go to a workbench desktop - and thats with a number of extra
'trimmings', a vanilla WB would take even less memory.

On the Apple Mac I use, the OS takes >3Mb depending on how
many extensions you use. 3Mb is about the lowest you can get the
OS memory requirement and still have the machine do all you want.

Cobblers. Why is a C program automatically 30% faster than an equivalent Pascal program? It's not; it depends on how you code, and how good your compiler is. Results the other way around would be just as feasible.

Hm. I didn't know that the original Mac ran at 7.8mhz although I
did know that Atari computers do I/O far more efficently than Macs and
PCs do. My MSTe seems far faster than my parent's Color Classic which
has a better CPU (68030 as opposed to 68000)... Thanks!

BZZZT! Wrong. The 68040 is *dual*-clock, not double-clocked. At most,
it can issue 33 million instructions/second.

Yeah, and not only do you need programs in your AUTO folder to patch the buggy
OS in ROM, when it comes time to upgrade, you have to open up your computer.
I still remember having to bring my 1040ST in to get it upgraded to TOS 1.4.
No thanks...

>And what's worse, NO OS should be that big. It just shows what lazy

I guess you haven't used any OS other than your precious TOS lately.
At least not one that offers more features than it...

Actually, I always thought it had to do with the way video memory was accessed.
I read in an old STart that the ST was designed so that the CPU and video
access to memory were interleaved so that there were no clashes, whereas this
was not the case on the Macs.

The CPU in the Mac no longer has to do all the I/O itself.

Wrong. My System takes up 1300K. Currently in my Extensions folder, I have:
9 Communications tools
5 Printer drivers
System Update 3.0
QuickTime
Sound Manager 3.0
Disinfectant
JPEGView JFIF Preview
QuickTime Windows Compressors

In my Control Panels folder I have all the standard control panels, plus
SuperClock. My System takes up 1300K, and it does everything I want it to
do. Even if I installed all the extensions I have -- that includes a CD
ROM driver, which I don't need -- it wouldn't take up 3Mb. What exactly
is it that you are using that causes you to take up 3Mb of memory on your
System???

And I'm sure you read ALL the Mac magazines...

There are over 200 pieces of native software, according to Apple's third
quarter report.

Did you read what I said, you airhead? If Apple ports a routine to PowerPC
native code, and the performance gain is not enough to cancel the effect of
the context switch required by switching from 68K mode to PowerPC and back,
then nothing is gained, and in fact some speed is lost, by making the OS
totally native.

PowerPC code does NOT run slower than 68K code.

>Pentiums.

A 66MHz 486 is still high-end. The majority of PC users are using 486/33
computers. You can compare the 66MHz 486 to a 40MHz 040. You can compare
the Pentium chips to the PPC chip with the closest clock-seed. And lets
not talk vapor. The 100MHz pentiums do not exist.

No, a 33MHz Quadra is not top-end. Only PPCs can be considered high-end.

> The HD in the PC is only 40 megs larger, and of course is IDE,
>so it should be slower than the SCSI model in the mac.

IDE is very similar in speed to SCSI. There used to be a difference but
that has eroded with time. Only 40Mb larger? That represents a 25%
increase in size for such a small drive.

> And Atari and Amiga owners get laughed at when they cite a small

>all these apps are now 100% native? I heard that photoshop for
>example has native drop in modules, but is still predominantly
>68k code.

Small for now. Unlike the Atari and Amiga the PPC has many developers
comitted to porting their products. The small library of native PPC
software (~100 commercial, ~30 shareware) can justify the purchase
of a PPC until for native software arrives. As long as your paint program,
your DTP program and your word processor are native your ok. You can
wait a few months for native games, com programs, shareware ,etc.
None of the packages I mentioned required you to purchase the entire
package. Many released the PPC version with additional features and
charged an upgrade fee. Some, Photoshop for example, offered the
upgrade for free. Photoshop is the only one that is not 100% native and
it still performs 300% faster than a 33MHz 040.

>> Yes, you can run Nextstep. But it'll cost you $1000 more dollars and

Source record: 16375

I don't understand Atari. I had a VCS when I was a kid. I had an Apple II and Commodore 64 later on. Then Amiga Lorraine came around and Commodore and Atari ripped the company to shreds. Tramiel quit Commodore and bought Atari with Commodore stock. The ST (Sam Tramiel) came out, which looked really cool. A guy I couldn't stand bought one and showed it off to me once, complete with TOS (Tramiel Operating System). Then I wanted a PC to play F19 Stealth Fighter on, and the salesman tried to sell me a Mega-2 because it had lots of ram. I bought a 286 instead, however, and played F19 a lot. Every once in a while I see an Atari commercial on TV. Then, about a year ago, I read in Fortune how Jack Tramiel ran Atari into the ground and wouldn't even allow a programmer to FedEx a package, thus losing a deal, because Jack is so stingy with money. Since it's privately held, nobody has any information on them, but apparently Atari sold $5 million of stuff in 1992, down from something like $400 million of stuff in 1982. By that estimate, it can be expected that about 10,000 hand-held game-boy thingies are in the marketplace, not really enough to build a market on. Now, Commodore goes bankrupt. What is happening to Atari? Are they just living off of the Tramiels' wealth? Have they stopped making personal computers altogether? I also read somewhere that software piracy killed the ST line, because all of the Commodore 64 pirates went and bought ST's, and immediately started pirating all the software, so nobody wanted to write for that platform anymore.

re: not fair to compare 33MHz 040 and 66MHz 486

That is not really true. The 33MHz 040 is also running at 66MHz
internally. I guess you did not realize that.

There is really no such think as a 66MHz 486. It is a 486 DX2 66,
which is 33MHz externally and 66MHz internally. The 33MHz 040 is also
66MHz internally, it is just Motorolla did not use that as a big
marketing item like Intel.

(You will notice that the new powerbook is listed as: 33/66Mhz 040 -
Apple decided to follows Intels lead)

As far as performance, however, a 33MHz 040 is faster than a 486 DX2 66
on most benchmarks. (SpecInt, SpecFp, etc). In real world applications
it is a little harder to compare. The 486DX2 is most likely running
DOS/Windows, so is hampered by a primarily 16bit OS (Windows DOES use some
32bit code, but not much). The 040 is running System 7, which is not
a terribly fast OS, but is 32bit. So who knows.

- mike

Had they done so I would have put off selling my Falcon! I was waiting and waiting for a decent and relatively inexpensive painting program for the machine but it never came out. The closest I saw was a French program called D2M but as far as I could tell it wasn't cheap or available in English!

Sure, I heard Chagall was also good - but not cheap either and really needs a VGA display which I didn't have at the time...

True Paint is available and is inexpensive. While it runs on all of the F030's video modes it is slow and featureless!

Ari

Gack!!!

The 68040 is NOT clock-doubled like the DX2s are.

What features? It offers a fairly basic set of functions. No more
than MS Windows does and certainly not as much as a standard UNIX
system.

As I pointed out in the post, there are a number of Faster chips
IN THE SAME PROCESSOR FAMILY. 75, 80 and 100MHz 486's and 60, 66 and
90 MHz Pentiums. The 486/66 is now a mid range performer in the
Intel x86 family. Thats a simple fact. Why do you find it so hard to
grasp? Just what are the majority of Mac users using? Is my 040 33MHz
mac better or worse than the 'majority' mac machine???

Oh, and I said the 100Mhz _soon_. Since we have 90Mhz models, I
don't think a 100Mhz version is _entirely_ unlikely, do you?

The only faster 040 chip in Macs is the 40Mhz model. And the
PPC runs 68k software (which is the vast majority of mac software)
slower than a 33Mhz 040 so I think I'm justified in saying that
the sluggish performance of my mac is near the top of current
mac performance.

> No, a 33MHz Quadra is not top-end. Only PPCs can be considered high-end.

Large models do run faster, but we are talking VERY much larger
here, like of 300 megs and above. SCSI is a LOT faster than IDE,

at least it is on the Amiga , ST and PC. I can't be held responsible
for the poor hardware design of the macintosh SCSI subsystem.

> >to splash out for a whole new package. BTW, are you saying that

ie, many packages have offered some replacement PPC code to boost
speed in certain areas. Hardly full-blown PPC support.

Having to use a 33Mhz 040 mac every day I think it's not
difficult to offer 300% better performance.

> support.

No, you implied that System 7 is superior to both OS/2 and NeXTstep
which is a load of crap. The only justification that could be gleaned
from your argument was that YOU had system 7 so it was better. Maybe
you can explain how system 7 has a better interface than Nextstep or
OS/2. More applications support, yes. But then DOS and Windows has
much more application support than System 7 and OS/2 can run DOS
and Windows. If you have a PC running nextstep, you can generally
just boot into DOS if desired.

> skim them?

i
Oh, sorry. You said 'yes you can run NextStep but ....' and you
were previously talking in the context of the Mac so I assumed you
meant that you could get a Mac version. I guess it was just my
desperation to run a decent OS on my Mac. The facts coming out
in this thread would seem to indicate that its not just the sloppy
programming of System 7 that slows the mac down though, it seems
that poor hardware design also has a lot to do with the abysmal
performance.

> ^^^
> And I'm sure you read ALL the Mac magazines...

> There are over 200 pieces of native software, according to Apple's third
> quarter report.

And how many have you seen. It's in Apples interest to hype the
machine as much as possible. And boy, have they been hyping it.
Many apple powermac advocates seeem to be under the impression
that the machine will run mac and windows software better than
existing machines .. not true. Thanks to a slick campaign many
appear to be of the opinion that it can run all Windows software
.. not true again. The emulation is only 286. And you'll need
at least 13 megs of RAM to get a softPC to run.
Some stupid mac
owners seem to believe that you at least get a 20Mhz 040 out
of emulation - sorry, but the emulation is only of an 020. and
without and co-pro maths support....

In short, we have an entirely new platform with limited support
and some slowish emulation software provided to ease transition.
Not quite the slick new Mac that many seem to beleive.

Of course, the Mac tends to attract the computer illiterate
anyway, so i suppose it's quite easy for apple to hype their
new platform. I wonder how many people bought PowerMacs who
werent already Mac owners? And how many who didnt only bought
them because they thought the powermac could do a good PC
emulation?

No, you are saying it PERFORMS slower than 68K code in this case.
You are running your OS under emulation because you want to try to
squeeze the most performance from EMULATED 68k code. Apple push all
this stuff about the new PPC chips but fail to mention that in fact
you will be spending most of your time running 68k code under
emulation. If the excuse (of why the PPC doesnt even have a native
OS) that you put forward is true, then Apple are as good as admitting
that they don't expect to see a lot of native software soon.

Tell me this, would a completely Native OS be faster or slower?

Maybe apple should be forced to point out the powermacs performance
in 68k modes instead of trying to hype it by quoting POTENTIAL
performance as if it were commomplace.

> >> According to Apple, there are now 200 pieces of native software out there,

Have you SEEN these 200 apps that Apple claim. The way most people
judge the amount of software available for a system is what they see
advertised mail order or in shops. If you can't buy the stuff, its
not a lot of good reading press releases from Apple.

Actually, I think MiNT is under port for the Mac. Maybe a NATIVE
PowerMac version will deliver on some of the potential of the chip.

It's such a pity a potentially powerful architecture like the PPC
series is being primarily pushed by a company like apple whose
software and hardware engineering skills leave so much to be
desired. Maybe the new IBM PPCs (with the rumoured hardware
x86<->PPC translation) can deliver on the PPC dream....

maybe PowerMac advocates should learn to understand the benefits
of having code written in the native machine language of a chip
vs burning power on emulating 68k code, before they tell the rest
of us what a great idea the PowerMac is.

Unfortunately for you, Amiga, Atari and even PC owners tend
to look below just the advertising gloss when they consider a
system. Thats why most mainstream PC/computing magazines are
giving the PPC such a hard time when they review it against
even 486/66 PC's, never mind Pentiums.

There is no benefit in having the OS written in 100% native code. Parts of the toolbox are left-overs from the Plus ere and are not used anymore. If these programs called natwive routines then the context switch would slow the program down.

True, and the 40MHz 040 is in the same familly as your Quadra. It would
seem that we have a difference of opinion as to the status of the 486/66.
No, I bet a 020 is the mean for mac, just as the 286/386 is probably the
mean for the PC.

> Oh, and I said the 100Mhz _soon_. Since we have 90Mhz models, I

A 25% increase in size is substantially larger. SCSI is not faster than
IDE. SCSI-2 fast and wide async is faster than IDE. Your Quadra does
not have that but my PPC...

> ie, many packages have offered some replacement PPC code to boost
>speed in certain areas. Hardly full-blown PPC support.

No, only one package did that. The others where fully native.

>just boot into DOS if desired.

I don't think that NeXTstep is inferior to system 7. I have a NeXT Cube at
school. I'm using it right now. The interface is cool, the multi-tasking is
excellent (though I think edit should be multi-threaded), I've only
crashed it 3 times in the last 2 years and the programming environment
is awsum. But I would never buy a NeXT since the platform is dead. I could
run the OS on an intel machine but the app support is not there, I'd lose
all the cool NeXT hardware and I'd have to pay a lot for it. I don't like
OS/2. The interface doesn't appear to me. I get a lot of faults when running
windows programs and OS/2 programs are virtually non-existant.

Funny, no mention of Atari, Falcon, etc.

I must be in the wrong group.

3091. Wolfenstein 3d - review/etc

Newsgroup: comp.sys.atari.advocacy
Date: 1994-07-27 19:36:21 UTC
From: draeger@lcc1.nsc.com
Message-ID: <CtM6GM.A4A@nsc.nsc.com>
Source record: 16194

I just picked up Wolfenstein 3d for the jag, and am very happy with it.

Although DOOM would have been better, this is a very major step for the Jag. This is really the first third party game available. It is also one of the best games available.

Also, this game is available on Super Nintendo, and is a horrible horrible port on that machine.

On the Jag, it is better than the PC game.

So also it is significant because it is the first PC to Jaguar port, a market I think Atari should pursue. (If they can get the PC market to support it to some extent, there will be a lot more high quality games that just can not be found on other game consoles).

Anyhow: it is basically the PC game. The sound is good. (Probably equivalent to having a SB 16 or Pro Audio Spectrum, althogh the Jags sound does not suffer from the quality problems all the PC sound cards have). The graphics are slightly better than the PC version, although on a 27" TV of course, you loose some quality. Even so the game looks good on a 27" TV and would probably look super on a VGA monitor of S-VHS monitor. (The latter I know the Jag supports. I don't know about the VGA monitor, although I heard the Jag could do that as well).

The speed is very good. In fact it is too fast if you have played the PC game. I am almost used to it. (It is probably about 2 to 3 times as fast as on my PC, which is a 33MHz 386. And it is doing it with higher resolution (IBM version only uses 320x200!) and better color). (In short, it is faster than the PC version on a Pentium using a medium sized viewport (view size was adjustable in IBM version, not in Jag version: uses full screen).

It has all 6 scenarios (although I am not sure if you can choose them, or if you play one after another). It has 4 levels of difficulty.

Two problems I have found: saving a game (in one of 3 spots) requires only hitting 1 key, which makes it too likely to overright a saved game. (i.e. new players might hit these keys to see what they do and wipe out your saved game). Also, I have not found a way to switch to the knife except for running out of bullets. The option key cycles through the other weapons. I sometimes like to use the knife to kill dogs. >:-)

Blah, Blah, Blah. Anyhow it is nice, and represents one of the only good things that has up to now happened to the Jag. I have no idea what quantities it is being made in, but it is selling out everywhere. (Then again the jag sold out everywhere, but I don't know how many were

made. Obviously the numbers are so far small compared to the game giants).

The game represented an easier port than DOOm would, I am sure, although I have heard that DOOM will probably come out for the Jag. (CAIN people: maybe we should send letters to ID thanking them for developing this software and encouragine further development?)

Anyhow, thats it.

>is it that you are using that causes you to take up 3Mb of memory on your
>System???

You have a very narrow view of this matter apparently. You are the exception. Very Very Very few systems take up 1300K. Most are about 2 to 3 MB.

I have only what I would consider essential, and it takes up 2.6MB. I am not complaining. I have enough memory that this is not a problem, but I have more than half of my extensions turned off because I don't want my system to take up 4MB!

(By the way, experiment: take out all the communications and printer drivers and see if your system size changes. Nope. That is what I thought. Don't count those as extensions, they have no resident code. Also most control panels do not take up memory. Use Now profile or startup manager to see what each item uses)

Things like ATM such down 330K. This extension can be very useful to some people. There are other hogs as well. Plus some applications (FoxPro, Now Contact, others) install extensions. (The FoxPro ones are not optional by the way).

I will bring a list of what extensions and control panels I use, if that would help you. But it is very easy to such down a lot of memory with System 7.

Also, why don't you move to the Mac groups? I use a mac, but also an IBM and an Atari. I don't think debating the merits of System 7 is really relevant to the Atari. There is NO DOUBT that System 7 has some inefficiencies in regards to speed and size. If you do not realize this, you do NOT understand the Mac and OSs in general. That does not mean it is a bad OS. Indeed it is very nice to use in comparison to Windows. Just don't confuse user friendliness with optimized and efficient code.

Atari is a PUBLIC corporation. It is not (and has not been since about 85)
a private company.

- mike

(They still make computers and the Jaguar video console. I don't know if
they will continue to make computers or not. The jaguar is doing OK so
far, but not spectacular.)

ST does stand for Sam Tramiel, president of Atari, and TOS does stand for Tramiel Operating System. This was from a 1985 interview with Jack himself (a rather egotistical person) in a trade journal (Byte, I think), so get with it. Also, a recent financial analysis by an underwriter mentioned that Tramiel was successful with the C-64 by being a price leader, but his efforts to do the same with Atari failed miserably because of a significant paradigm shift in the personal computer market. Adam Osborne, in his book, "Thriving on Chaos" (1984, I think), spoke very highly of Tramiel after he left Commodore (and before taking over Atari), and said that Jack knew something about the market that nobody else did. I wonder what he thinks about him now.

> program down.

The only situation where there is 'no benefit' in having the OS in
native code is one where you are going to be spending your time running
a lot of 68k software under emulation. If this is the case, then in
fact you are only getting a small fraction of the potential of your
PPC chip. A pretty silly situation, and frankly if you are running 68K
code then you'd be better off with a REAL 68k mac. Now, apple are hyping
the speed and power of the PPC chip but they fail to mention that it
doesn't deliver this speed and power on existing software.

Look at this situation,

Motorola make the PPC chips, a tremendously powerful series of
chips.
Apple make the first PPC machines, BUT (a) They expect that
users will mostly run 68k software under emulation (thus burning
off a lot of CPU power) and (b) Put the machines into an
architecture not actually designed around the chips (the whole
system is designed around an earlier motorola risc chip, I think
it was the 88000 or something like that...) again compromising
performance.

End result: Although the PPC chips show great promise and potential
the actualt results are limited by apples poor design.

The real breakthrough will come if IBM can come up trumps
with their PPC machines, the ones with the rumoured 80x86
hardware translation. Then the way will be open to port software
to windows NT and 80x86 compatibility will become a thing of the
past.

> > Unfortunately for you, Amiga, Atari and even PC owners tend
> >to look below just the advertising gloss when they consider a
> >system. Thats why most mainstream PC/computing magazines are
> >giving the PPC such a hard time when they review it against

> >even 486/66 PC's, never mind Pentiums.

> You don't think that PC magazines are biased?

By PC magazines, I meant buisiness oriented computing magazines.
By default, this means PC since the business world is mainly PC
(about 80% or so). There is no doubt a bit of inherent PC bias
since thats what platform they know best, but most PC mags do
give the mac fair reviews. However, Apple have squarely targetted
the PC with their advertising, making a big deal of the PowerMacs
supposed PC/Windows compatibility. So are many Mac advocates,
claiming you can just pick your platform and run it one the
PowerMac.

Now, with all this hype from apple the magazines have started
to review the PowerMac along with things like 486 clones. The result
is that people are now seeing that the PC emulation is AWFUL (286 only)
and that for current software its SLOWER than existing 040 Macs.
They do point out that native software would be faster but also
that theres not much of it about.

The simple fact is that Apple got a tremendous amount of hype
when it first came out - about being super powerful and able to
run a wide range of platforms, but when people actually look
at it under an analytical light, it fails miserably to deliver
on all the Apple promises.

I know all about context switching. What I don't understand is why
people would want to buy a powerful machine and then burn off all
its power emulating another chip. The fact is that a native OS would
be faster. Unless of course you are going to be running mainly 68k
code, in which case WHY ON EARTH DID YOU BUY A POWER PC BASED MACHINE?

Exactly, powermac buyers are caught in a halfway house. Not that
you'd know this from the way Apple are marketting the machine.
You'd almost think that everything would run faster and in the near
future everything would be faster again....

I do have an honours degree in IT and a Masters in Electronics..

But you don't have to be an expert to see that Apple have never
made state of the art platforms. From the Apple II (which was
quickly bettered by the Atari 800) to the Macinstosh (which was
easily beaten by the ST and later the Amiga) to a PPC platform
now which doesn't take advantage of the full capabilities of
the chip.

In that case they changed their mind because everytime I have seen comment from
the Trameils of Atari in general, it's always ST=Sixteen/ThirtyTwo and TT =
ThirtyTwo./ThirtyTwo. Plus there is no T Tramiel so where does TT come from?
Ditto on TOS, Atari have always said it's The Operating System whenever I have
seen them mention it.

I'm not saying Sam didn't say the above, he just changed his mind.

Their is a a benefit in having the majority of the OS running in native mode.
Apple estimates that 90% of the OS calls made by modern programs are to
native routines. A modern program probably does not call 'Create'. This routine
has been obsolete for the last five? years. The new call is 'FSSCreate'. Since
only programs made five years ago use 'Create' and if they haven't been
updated in that long they probably won't be ported to PPC, why force a
context switch my writting it in 601 assembly? The PPC oprograms are
newer and thus use the modern routine 'FSSCreate'. It's 'FSSCreate' that should
be native. There is NO BENIFIT in porting 'Create'. However, 90% of the
modern routines are native (though I don't think 'FSSCreate' is).

What it comes down to is that the PPC compares favorable to the Pentium
when running native apps. I think that the only app native to both that
ran faster on the Pentium was Word Perfect.

> End result: Although the PPC chips show great promise and potential

Maybe, but it could also go like OS/2. Since it runs so well on PPC why write a PPC only version? That's what windows developers thought about OS/2.

Did apple promise fast 80x86 emmulation, did they promise that the 680x0 emulation would be faster than a 68040? No. They promised that the native programs would be faster than the 68040 and it is.

>
> Hey wake up, we have e-mail in Europe, too ;-)
>

Hey, if you Europeans want to be placed on this list, YOU have to do the
waking up!

Users will not be placed on the list unless the maintainer (myself)
receives e-mail from the person.

Why do I do this? I don't want to get bitched at by people because they
are on a Who's Who list when they want to remain as silent as possible.
Some people like it that their e-mail address isn't well-known.

Another reason is because ALL the people on the list KNOW that they are on
the list. If a situation would change concerning their status or e-mail
address, they realize they are on the list and contact me.

If you want to be placed on the Who's Who list then give me information about
yourself. If you want a favorite developer of yours to be placed on
this list, tell them so they can write me.

Its hard to say, at the time the STs came out many thought
that ST stood for Sam Tramiel but it was denied by Jack and
he stated it was Sixteen Thirtytwo. Who knows. I am pretty
sure though, that TOS did mean 'Tramiel Operating System` ..
it was certainly used by most magazines at the time.

I don't think its enough to simply have good performance. You
also need the software to utilize this performance. The computer
market is a software driven market , its software compatability
thats forced the unfortunate Intel x86 dominance and this fact
hasn't changed with the advent of the PPC chips. If you want
out and out performance why not go for a DEC Alpha machine, or a
SPARC? There have always been better machines around than the PC,
when the Amiga and ST were first released they were both a LOT
better than any PC and a hell of a lot cheaper.

> > End result: Although the PPC chips show great promise and potential

Yes, thats a danger but if PPC becomes widespread enough and
a Windows NT version becomes available for it then it will be
worth manufacturers time to port their products to NT in order

to gain performance advantages. This is good news for other
chips too - the Alpha and MIPS spring to mind here. And the
market gets to dump DOS and Windows.

> >give the mac fair reviews. However, Apple have squarely targetted

Apple marketting is excellent! The Mac has always been slickly
marketted and presented. My gripe with them is that they often
severly bend th truth to sell macs - the PPC advertising being
a case in point. I know all marketting depts. do this to an
extent but Apple are particularly guilty here.

> > Now, with all this hype from apple the magazines have started

If the Apps you want are native, then its certainly worth
getting a PPC machine.

> > The simple fact is that Apple got a tremendous amount of hype

The marketting campaign does imply that the PowerMac will run
ALL your software better. It pushes the 'PPC is Ultra Fast' line
and then majors on its ability to run PC software, implying that
your PC software will also run with the same excellent level of
performance. Same goes for Mac 68k software compatibility.

Many people do fall for this (many Mac advocates too it seems)
and the result is that PC mags are pointing out the capabilities
of PowerMacs when they try to run PC software. Its a hard
judgement, but Apple have put the PowerMac competing against the
PC on its own turf and magazines have a duty to inform their

readers of the truth.

True, software is important and that is why apple is pushing developers to
port their apps. Apple itself is planing to have an almost totally
native OS by 8.0. I was thinking about getting a SGI before I bought my
PPC but it was to expenive and so was the software.

>> Maybe, but it could also go like OS/2. Since it runs so well on PPC why
>> write a PPC only version? That's what windows developers thought about
>> OS/2.

> Yes, thats a danger but if PPC becomes widespread enough and
>a Windows NT version becomes available for it then it will be
>worth manufacturers time to port their products to NT in order
>to gain performance advantages. This is good news for other
>chips too - the Alpha and MIPS spring to mind here. And the
>market gets to dump DOS and Windows.

Well, asumming the 'we will port when the market is big enough. we bill buy
when the software is available' doesn't prevail than IBM have do well.

> Apple marketting is excellent! The Mac has always been slickly
>marketted and presented. My gripe with them is that they often
>severly bend th truth to sell macs - the PPC advertising being
>a case in point. I know all marketting depts. do this to an
>extent but Apple are particularly guilty here.

That, I think, is bad in the long run. When I bought my PPC I forgot about
running IBM programs and realized that my 680x0 apps would run slower.
But, in my case I use many native apps so it doesn't matter. Many users
may have bought PPCs thinking that everthing would be faster. Sure,
Apple sold a computer now but that may hurt their futur market.

> The marketting campaign does imply that the PowerMac will run
>ALL your software better. It pushes the 'PPC is Ultra Fast' line
>and then majors on its ability to run PC software, implying that
>your PC software will also run with the same excellent level of

>performance. Same goes for Mac 68k software compatibility.

An implication is not a statement but I take your point.

> Many people do fall for this (many Mac advocates too it seems)
>and the result is that PC mags are pointing out the capabilities
>of PowerMacs when they try to run PC software. Its a hard
>judgement, but Apple have put the PowerMac competing against the
>PC on its own turf and magazines have a duty to inform their
>readers of the truth.

It's sad but true that most computer users don't have a clue and that major
corporations don't help them any.

One thing's absolutely for certain about Atari computers....

They're damn near impossible to get repaired.

My local dealer can't repair it... he'd send it back to Atari.

I can't send it to a different dealer because Atari won't reimburse them for the repair.

Atari tells me that the repair will take 3 to 4 weeks. That's absurd. Besides, we know they're liars... it'll take more like 2 to 3 months!

I do work on my computer. I can do without sound (that's what's broken) for a little while, but since there is only a month left for my warrantee, I have to get it repaired within that time.

Atari won't give me a loaner machine either, nor will they just replace the defective one.

Plus, it's going to cost me an arm and a leg to get it to them.

What a crock.

: PS: please, answer by mail to gouida@glas.apc.org

ANSITerm is a very nice VT100/VT102/ANSI terminal program. It's probably the fastest around and it does 16-color ANSI on a stock ST. It also works wonderfully with UNIX.

I'm facing the same situation, Tim. I figured that I could send it to any Atari dealer because Atari just pays for all warranty work. Wrong. I contacted the dealer I bought it from. They told me that they didn't have the part in stock and that I should just send it to Atari (couldn't they order the part now?!). Atari told me that I needed a receipt (woops, I guess my warranty card isn't good enough) and that it would take 2-3 weeks to fix once in the warehouse. All for a broken microphone port.... I am pondering whether I should just pay for the work to get it done locally or actually send it to Atari....

Yes, video access is part of the reason the original ST series ran up to 20% faster than the MAC and MAC+. It also had to do with the ST's DMA controller. While it wasn't as comphrehensive a device as on other systems, it did (does) allow for fast floppy and HD access. Old Mac drives were variable speed and controlled by the CPU much like the PCjr's 8088 used to control its drives.

ST video access is a form of local bus in terms of performance. The ST's processor runs slightly faster as well.

Blame your dealer; it's not Atari's fault. If your dealer can't do repairs, he should have told you this when buying the machine. He should have told you that if anything goes wrong, he'll have to send it to Atari which will take time. Have your dealer give you a loaner while he sends it off to be repaired.

Again, have the dealer order the part. When it's in, bring in
your machine or send it back to the dealer. It _should_ take
less time than sending it to Atari.

The problem is that there aren't many dealers around any longer
(like this is something new!). Making this matter worse is the fact that
many of them can't/won't do repairs. There's not much we can do
if something goes wrong, warrantee or not.

3119. Want some computer gaming fun? CAIN Atari Fun Fest 94

Newsgroup: comp.sys.atari.advocacy
Date: 1994-08-01 03:51:11 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <31hrff$2ma@usenet.INS.CWRU.Edu>
Source record: 16218
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

This will be the last Usenet posting about this show besides the complete dealer/vendor, developer, user group listing which will be posted on Thursday.

CAIN Atari Fun Fest 94

Are you bored of playing the same old games?

Do you have an Atari Jaguar, Lynx, ST, TT, Falcon030, 800, XL, XE, XEGS, 7800, 5200, or 2600?

If you have any one of these systems, you can get games for it at the CAIN Atari Fun Fest 94.

CAIN Atari Fun Fest 94 is being held on Sunday, August 7, 1994 at Kirtland, Ohio (near Cleveland). CAIN Atari Fun Fest 94 will be fun for the entire family. You'll get an opportunity to see the JAGUAR 64-BIT Interactive Multimedia System and the latest entertainment titles for it. You'll even get to see video games played like they have never been played before! And that is through Lynx portable video game systems all linked together. This incredible multi-player action will blow your mind away!

The new Atari Falcon030 computer will be there along with the ST and 8-Bit computers!

There will be prizes to win and you might even be one of the lucky people to take home a Jaguar 64-BIT system or a Tempest 2000 cartridge (courtesy of Atari Corporation)! There will be many prizes raffled off such as gift certificates and games of all sorts! Everyone that attends will get a chance to win!

CAIN Atari Fun Fest 94 is the Atari -=- FUN -=- show of the year! Don't miss it! Bring the entire family down! Get great deals! See the latest technology! And have a lot of fun!

Central Atari Information Network

Are there any decent games/demos, especially games out now
for the Falcon that can run on a VGA monitor? I bought my
Falcon about eight months ago and upgraded my Lattice C, but
after a few months I stopped keeping track of any new releases...
do these new releases actually exist?

Mark

There are loads of demos but nothing too startling. There are a few Falcon only
games like IShar1 & 2 and Transartica. Ishar 3 may be coming out in Falcon only
version. There are a fair few PD games including Starball, a nice pinball game
that plays well on the Falcon.

What does Gack!!! mean.

OK OK 68040 are not clock doubled, they do infact take in a processor
clock and a bus clock, now a 33MHz 68040 uses a 33MHz Bus clock and a 66MHz
Processor Clock and obviously this is nothing like a DX2 chip (NOT!)

Demos??? Well unfortunately MOST demos are for RGB only- but there are a few
that work on VGA- the most recent (and best) demo that works on VGA is the
knockout demo. Make sure you read the epilepsy (sp?) warning at the start
though. ;)

Apple never made the claim that 68XXX software would be faster on the
PowerMacs. Apple made the claim that 030 Mac users who upgraded to PowerMacs
early would have the same performance level upto a 040-25mhz. And Mac
Magazines have pointed that out.

MacWorld-Boston will show case the over 200 PowerMac Apps. You will beable to
purchase with your hearts desire..

The PowerMacs that are bundled with SoftPC come standard with 16 megs of ram.
Even these configurations are still cheaper than A4000/040.

Or you can get a Houdini board for under $400 that gives you 486 speed.

It's absurb that a Toaster system needs at least 10 megs to run efficiently.
Why does A Toaster tie up the Amiga? I thought the Amiga is multitasking
system.

> Some stupid mac

Don't forget to ad, that the Amiga stopped advancing in hardware-software/
price-performance. Todays Amigas suck in comparison to Apple's current
offerings. Evidense:The public. The public was not dumb to buy a machine
that was only capable of formatting a disk and playing a Atari 2600 style game!

Hmmmm.... that's a good idea. Of course, the dealer told me
that it would take less time to send the system to Atari then
to send it to themand have them get the part. On the other
hand, I may not need a new part. Perhaps it is just a loose
soldering job? I have no idea. I don't know how the dealer
would know either. My gripe is that I cannot get any dealer
to do warranty work. Atari should pay any dealer for warranty
work, IMO. Or, what would be wrong with this? I bought it
from this dealer because they gave me a good deal on a trade
in but I'd rather get it repaired somewhere closer.

Why is Atari untrustworthy? They said they would fix it if I sent it in to them. What is wrong with that arrangement? I just do not wish to be without a computer for that long. If I had a Macintosh I could not just go to my local Mac dealer (there is none) and I certainly would not want to entrust my machine to the boneheads at my campus Mac retailer (who charge incredibly high prices for repair work once the warranty is gone).
Yes, I would still advocate an Atari to users. I just got the Toad Catalog chock full of software and hardware for the Atari (including TTs, Mega STes, STacys and, of course, Falcons).

clock and a bus clock, now a 33MHz 68040 uses a 33MHz Bus clock and a
66MHz
Processor Clock and obviously this is nothing like a DX2 chip (NOT!)
===

Only the pipes of an 040 are clock-doubled. The FPU, ALU, caches, and
everything else is executing on the bus clock. Now, you can call that
clock doubled if you want, but considering that all of a clock-multiplied
486 is running at n times the bus clock, the distinction seems to be
irrelevant in the case of the 040.

Besides, if the 040, which has been around for 3 or so years, has been
clock doubled all this time and noone ever knew it before, Motorola needs
to hire some new marketing staff.

I agree that a dealer should do warranty work _and_ Atari should honor
that warranty regardless of the point of purchase. However, I still
feel that the dealer should inform customers whether or not they do
repairs, warranty work, etc. Also, as customers, we should ask those
same questions!

So what? We were discussing the overall performance for price compared
to existing macs. Of course, since my humble A1200 with 020 manages to
feel more fluid than a Mac Quadra with 040 then its a fair bet that
an 040 Amiga will be nicer to use than a PowerMac running software under
emulation.

> Or you can get a Houdini board for under $400 that gives you 486 speed.

I take it you are referring to the gripes expressed about the OS
taking lots of memory on a Mac. The fact that a rendering program takes
10 megs is neither here nor there. The Video Toaster is a specialised
video product - any Amigas running it are invariably _dedicated_ to that
task. As usual, you've just spouted a load of crap in trying to compare
an operating system with an application. Still, it's only to be expected
from you so we have to make allowances.

> > Of course, the Mac tends to attract the computer illiterate

> Well my brother has a Houdini/Q660AV setup. Has the best of both worlds.
> Works very well.

And of course you can get a bridgeboard for the Amiga or a number
of products for the Atari. Oh, and of course both the Amiga and Atari

can do an excellent emulation of the mac. So if your Mac is so
wonderful and superior to these platforms, how is it that we can
simply get an emu and run all those mac applications on our machines
and usually at a higher speed than the equivalent mac model?

And yes, it windows and dos compatibility isn't important then
you probably did buy a Mac. After all, most mac owners are the sort
who aren't exactly clued in on the computer business.

> Define illiterate? I know lots of users who are pros at Excell, Word and other
> businness apps. Oh I forgot they dont program, so their illiterate.

> I could not care about programming. I have better uses with my time..

Yep, you probably wouldn't be able to grasp the concepts involved. No
doubt you cant fathom Unix or DOS either. I'm glad you've found a computer
thats simple enough for your simple intellect to come to terms with.

: -Ben Keen

Hmmm

If the pipeline runs at 66Mhz and the ALU runs at 33MHz do they rely on
every other instruction not passing through the ALU??

Surely the BUS controller part of the 486 runs at 33MHz at some stage.

How does a 33MHz cache keep a 66MHz pipeline filled.

You clearly have no understanding of what a Toaster is or what it does. It is designed to produce broadcast quality grahics and animation. This requires huge amounts of RAM and storage and frankly, I'm amazed it does what it does in only 10Mb. I'm no Amiga lover but the Toaster is a very nice piece of kit which whether you like it or not, proves there is most definetly life outside the PC/Mac arena.

I don't know what Atari's feeling on this is. It _could_ be that dealers used to complain that they were losing warrantee work to non-POS dealers - so Atari stated they wouldn't honor those. I don't know.

Personally, I think a warrantee is a warrantee and it should be honored by the parent company regardless of where the machine was bought.

As to beign without your machine for that long, I can understand that! Are you going to the CT show at the end of the month? There's a dealer who will be there that does on-the-spot repairs. If yours is a minor repair, you'd be in luck and have it back the same day. At the least, you could learn what was wrong with it and go from there.

Iain.Laskey@barclays.co.uk writes:

>|> - Drag and Drop

Drag a file onto an applications icon and the application loads up and opens
that document.

>|> - Publish and Subscribe

A way of hot linking documents from diffent programs. A change in the published
document will show up in the document that subscribes it automatically.

>|> - Direct file manipulation (with finder)

Moving a file to a folder really moves/copies that file. TOS has it, finger
has it but it's still clumsy in windows.

>|> - Transparent file typing

MacOS mantains file types without resorting to extension mapping.

>|> - Scripting

The usual plus a twist. You can script normal file manipulation but also script
actual programs. For example to view jpegs I drag the icons of the pictures
onto the icon of this compiled script:

```
on open fileList
tell application "JPEGView"
activate
slide show fileList B
with images from disk, filenames, no errors,
recursive scan, user control,
offscreen drawing and hidden windoids without shuffling,
looping, screen saver, hidden controls and auto comments
end tell
end open
```

An automated grading scheme could be made something like this:

```
display dialog "Enter you name and student number:"
default answer "" buttons {"OK"} default button "OK"

set fname to text returned of result

display dialog "In what year was juggling invented: "
default answer "" buttons {"OK"} default button "OK"

set jdate to text returned of result
```

```
tell application "Scriptable Text Editor"
set selection to
("In what year was juggling invented: " & jdate)
save document 1 in file ("Quizes:" & fname & " Quiz")
/* more questions here */
save document 1
quit saving ask
end tell
```

>>|> - Drag and Drop

TOS has had it since 2.0

>>|> - Publish and Subscribe

Only really useful over networks. If STs were a larger presence in the
business world, it'd be there... Given the market right now, I'm not
surprised it isn't.

>>|> - Direct file manipulation (with finder)

Of course, Apple has only had this for a short time... There was apparently
a BIG stink when the real HFS (Hierarchical FIle System) was introduced
about Sys 4 wasn't it? THat's right, before then, folders were just virtual
directories and all your files sat functionally in one huge directory...

And, with the FIle Manager under Windows, it's got it too...

And also, Aliases don't copy the original file... When I drag a desktop
Icon on my Falcon to another drive or the trash, it will copy the original
file, or prompt me if I want to delete the original or just remove the icon.

>>|> - Transparent file typing

That's not a feature, it's an annoying as hell limitation.

>>|> - Scripting

Is this really implemented in the Mac OS yet??? It wasn't as recently as Sys
7.1. I hear 7.5 or 8.0 might have it...
And, it is doable on the ST, just most programs would not support it because
it requires an outside batch processing program (I've seen them) and it
requires that the applications executed accepts command line parameters,
which newer ones do, but not all.

And, really, isn't the point of the Mac to get away from nasty command-line
and batch file driven DOD yuckies and do it all with nice windows and buttons?
Oh, that's right. the point WAS to get away from it. THe point now is to
sell machines to everyone, which means trying to do everything, and not really
succeeding, either...

Understood. Windows apps do that.

Useful. There is a 3rd party Atari prog that does the same thing but it would be
nice to have it built in.

I'd disagree here. It's very nice to have a document in a WP that holds stats data and graphs derived from a DB. If you can automatically update the data each time the document is opened, it saves alot of hassle, network or otherwise.

Macintosh Drag and Drop is more advanced than the limited implementation
TOS offers (which isn't even supported by all applications -- there were
quite a few programs I had on my Mega STe with TOS 2.05 that would NOT open
a file when you double-clicked on it or dragged it to their icon.)

Macintosh Drag and Drop allows you directly drag a selection from one
document window to another, without using the Edit menu to cut and paste.

>>>|> - Publish and Subscribe
>
>Only really useful over networks. If STs were a larger presence in the

Publish and Subscribe is pretty useful, not just over networks...
but I thought MultiTOS had something like Publish and Subscribe, or am I
mistaken?

>>>|> - Direct file manipulation (with finder)
>

>directories and all your files sat functionally in one huge directory...

What does that have to do with direct file manipulation? If I'm not mistaken,
he was referring to the Finder, in which your windows always represent the
current state of your disk, unlike the Program Manager in Windows, for example.

>And, with the FIle Manager under Windows, it's got it too...
>
>And also, Aliases don't copy the original file... When I drag a desktop

>file, or prompt me if I want to delete the original or just remove the icon.

Aliases are different that the desktop icons in TOS. The desktop icons in TOS
are more limited in that they are simply another icon for the same file --
not a different file which points to the original file, like Mac aliases.
They are two different things. I don't think the Mac has anything like TOS

desktop icons. Every icon on a Mac represents a distinct file or device --
aliases may point to an original file, but they are physically separate files
from the original. This is in contrast to TOS, where file icons on the desktop
are not separate files (on the Mac, for example, when you move a file to the
desktop, the actual file is moved there, whereas TOS simply creates a new icon
for it. TOS desktop icons are like limited versions of aliases).

>>>|> - Transparent file typing
>
>That's not a feature, it's an annoying as hell limitation.

You bet it's a feature. None of this "Install Application" business...
How is it a limitation? The only problem I can see arises when you download
files from a DOS machine, but even then, all you have to do is use a simple
Shareware program to properly type the file.

>>>|> - Scripting
>
>Is this really implemented in the Mac OS yet??? It wasn't as recently as Sys
>7.1. I hear 7.5 or 8.0 might have it...

It has been available separately for a while, but will become part of the
standard System as of System 7.5, which will be released in a month or so.

Scripting is different that the antiquated DOS-style batch processing
you are thinking of. AppleScript is in a way, like a giant Macro language
which lets you script applications that support it. AppleScript is not a
command line interface. You have obviously never seen or used AppleScript.

THe actual file is not moved to the desktop... the file is moved to the
"Desktop FOlder" which is NOT direct file manipulation by any means... same
as the trash being put into the trash directory... I prefer the TOS way.
The only thing Aliases are really good for is putting on the desktop or into
your Apple menu. Apple ALiases are really bad hacks, and I hate that they
are considered separate files...

>You bet it's a feature. None of this "Install Application" business...

No, the problem is that if you have application X which writes a type of
file, and your friend has application Y which reads the same type of file,
but is a different application, the whole "transparent file typing" thing
gets really reamed as your friend is told that he does not have application
X and so must manually load the file. If you bothj have applications
successfully installed under TOS, then you can exchange files much easier
bnetween applications. Then there's the fact that if there's a file type
that is, say, almost text, and you just want to read it, you have almost
no way to even load it, since all file types are masked "transparently" by an
application, you cannot ever override it to force an application to load a

file. DOes this make sense? I do this a lot, and nearly beat up my work
mac several times for this...

>you are thinking of. AppleScript is in a way, like a giant Macro language

DOS is a scripting language. any Unix shell is a scripting language. The
only difference is in Apple's Marketing department.

Drag and Drop is not a replacement for the Edit menu (a universal clipboard
is included in TOS, but is not supported by more than a handful of
applications. Almost every Mac application supports the clipboard) Drag and
drop is available *in addition to* the regular methods of cut and paste.

>THe actual file is not moved to the desktop... the file is moved to the

OK, I can see your point. The Desktop and the Trash are two exceptions.

>The only thing Aliases are really good for is putting on the desktop or into
>your Apple menu.

That's not true. You can keep files physically separate but group them
together for a certain project by using aliases. It's also handy to place
an alias of a file on a server on your desktop. If you don't want to use
aliases, no one is forcing you, but even if aliases were no good for anything
other than putting in your Apple menu or on your desktop, I still would want
them.

I wonder if you're discounting their usefulness just because TOS doesn't have
something like them...

> Apple ALiases are really bad hacks, and I hate that they
>are considered separate files...

How, pray tell, are they "really bad hacks?"
As for aliases being separate files, not phantom icons on the desktop, that
means that they can be accessed from within applications other than the
Finder. It also means that, in effect, you can have a file in many places
at once, unlike in TOS where you can have a file in two places -- its original
home and the desktop.

>No, the problem is that if you have application X which writes a type of
>file, and your friend has application Y which reads the same type of file,
>but is a different application, the whole "transparent file typing" thing
>gets really reamed as your friend is told that he does not have application
>X and so must manually load the file.

These are two separate things -- there are file types and file creators.
The file type indicates the type of information in the file. (GIF, text,
etc.) The creator indicates the application that created the file. Yes,
your friend will have to either use the Open... command from within his
application or drag it to the application icon manually, but such a rare
incovenience is a small price to pay for having something as time-saving
as transparent file-typing. Macintosh Easy Open fixes this. When you
double-click on a file whose creator is not present, it offers you a list of
applications which can handle that type of file. It also has built-in
translators. Macintosh Easy Open has already been released and will become
part of the standard System distribution in System 7.5.

>file. DOes this make sense? I do this a lot, and nearly beat up my work
>mac several times for this...

I'm not sure what you mean... if application X created a file, presumably
it can read that same file...
There are several shareware/freeware and commercial utilities that let you
change a file type manually. Again, I don't see how this would be a problem
unless you are dealing with a file downloaded from a non-Mac machine.

>>you are thinking of. AppleScript is in a way like a giant Macro language

DOS is a command line interface. A Unix shell is a command line interface.
AppleScript is not a command line. Although you can script applications in
a similar way to DOS or a Unix shell, it is *not* a CLI.

No, the DOS command line is a one command at a time script interpreter. A Batch file is a full script interpreted as such. A Unix shell can interpret commands one at a time or as a batch, just like DOS, including multiple parameter checking, interactive input/output, etc. It's nothing new at all. Apple just wants you to think it is... DOS and Unix are damn powerful, but very clunky. Applescript can be the same, but given it's by Apple, I bet they'll forget the damn powerful part and just make it Damn clunky. That's the Apple way...

Hello

I would like to engage in a little mental excercise here.

If Atari were to attempt to re-enter the Personal Computer market in a meaningful way, how should they do it?

What type of platform and architecture should a new design follow? CPU type? Bus architecture?

What type of OS (personal choice here would be a Mach based system that would look like NeXT: NeXT Lite?)? Should there be a TOS compatibility layer?

Anyway, just interested in what people think

Thanx

Run MultiTOS, use the minixFS filesystem rather than the TOS one and
get symbolic and hard links. There's the underlying functionality.
Now run a replacement desktop (which is hardly uncommon) and hey
presto you have aliases. But who really needs them ?

! >>you are thinking of. AppleScript is in a way like a giant Macro language
! >>which lets you script applications that support it. AppleScript is not a
! >>command line interface. You have obviously never seen or used AppleScript.
! >
! >DOS is a scripting language. any Unix shell is a scripting language. The
! >only difference is in Apple's Marketing department.
!
! DOS is a command line interface. A Unix shell is a command line interface.
! AppleScript is not a command line. Although you can script applications in
! a similar way to DOS or a Unix shell, it is *not* a CLI.

Yes, it's a sort of cross between an event collector and a CLI. You can
use events as inputs, and generate events as outputs, but basically
it has the functionality of a CLI. Remarkably like the GEMrecorder
class in GEM++ ...

Simon.

The best use I can think of for aliases or links is on a multi user system
and have links in each users directories to common files stored in one
place, to avoid wasting disk space by having lots of copies of the same
file.
I can't really see the point of having them on a single user system. All
it would save is changing directory a few times.
If you want to group files together for a project would it really save
much time making aliases for these instead of just copying them into one
folder?

My personal view is that Macs are purely for the benefit of computer
illiterate people. They are easy to use for a beginner. If you want to
get the most out of a system, ie push it's performance to the limits, you
will get much more out of other systems which have not got all this "user
friendliness" to get in the way. Of course, once you get used to one
thing you don't like changing over to something different, however good
it may be.

AppleScript is fairly powerful. As types it has strings, sets, integers, reals and rationals. It allows you to reference each type from it's most logical form to it's underlying machine representation. AppleScript is object-oriented and uses polymorphism for opening, quiting, printing and starting applications. It also features exception handling and for, while and repeat loops. AppleScript is very robust and powerful. You will notice that AppleScript uses exception handling which isn't a finalised standard in C++. AppleScript can interact with other applications or directly with the user. If AppleScript proves inadequate/inefficient for a certain task it can call upon external code resources. The only thing that stops me from doing everything in AppleScript is the lack of toolbox support, the inefficient compiler (did I mention that AppleScripts are compiled into executables?) and the lack of user defined types. Did I forget that you can build scripts by recording your actions and letting it build the source code?

If you mean the JAGUAR chip-set, YES!

>5. It should be priced at least competitively.

Jepp...

>6. It should have a built in DSP

It would propably have a DSP to be compatible with existing FALCON code.

>7. It should have fancy built in sound capability like the new sound blaster

Which NEW soundblaster... The FALCON sound is still better then ANY I heard
on a PeeCee... And I would love to hear what the JAGUAR is capable of!

Short: A ATARI with PPC, JAGUAR chip-set, MultiTOS (Maybe with X ported!),
a deacent casing, 8 MEG RAM, 500 MEG HD... and a price about 1500$
(With ATARI I mean a computer wich have the things that other ATARIs have
such as MIDI, SCSI...)

That is what we would like to see from our local ATARI dealer!

:
: -Dana

No. You don't understand. I've talked to several dealers and they can't repair under warranty. Well, they can, but Atari won't reimburse them for the parts... even if you take it to the dealer you bought it from.

This is a recent change from the way Atari used to do it.

I was being starcastic(sp) to prove a point. I know very well what a Toaster
is. I was an Amiga user at one time. A friend owns a Toaster, very nice
indeed. A Toaster with Lightwave to be very useful requires more than 10 megs
of ram to show its power. The same point could be made with Photoshop,
Pagemaker, QuarkExpress, Premiere and so on. None of these Apps are available
on the ST and Amiga platform. But, than the Mac platform is criticised because
these Apps need more memory to show its power. However, there are tons of
useful apps that can run affectively on a four meg configuration. I have been
able to use WriteNow, Zterm, Personal organizer/calendar and another App all
running at the same time.

Amiga games at one time were awesome but are not unique today. I have seen
games for Windows as well as the Mac that put Amiga games to shame. Most
Amigas are low res ones and not to many games are in hi res(at least 600/400).

! >class in GEM++ ...
!
! As types it has strings, sets, integers, reals and rationals.

It has types... why not have this as transparent (eg: perl, tcl) ?

! It allows you to reference each type from it's most logical
! form to it's underlying machine representation.

So it has types, but it doesn't care if you use them...

! AppleScript is object-oriented and uses polymorphism for opening,
! quiting, printing and starting applications.

OO is no big deal - who cares? Now beanbags are polymorphic... Not
sure which applications are ... I assume you mean it can handle lots
of types of apps, or maybe even all types of apps. So, it just sends
an event to the application, and gets the app to do the hard work
then ? Sounds pretty simple when it's expressed like that...

! It also features exception handling and for, while and repeat loops.

So show me a CLI that doesn't.

! AppleScript can interact with other applications or directly with
! the user.

Hmm, seems the same as above.

! If AppleScript proves inadequate/inefficient for a certain task
! it can call upon external code resources.

It can run programs then... Or maybe even start an overlay.

! The only thing that stops me from doing everything in
! AppleScript is the lack of toolbox support, the inefficient compiler
! (did I mention that AppleScripts are compiled into executables?)

Now that's useful. A macro recorder is pretty boring, even one with
loops, but the facility to speed things up is useful.

! and the lack of user defined types. Did I forget that you can build
! scripts by recording your actions and letting it build the source

! code?

What was that I said about a GEMrecorder class ?
I don't think applescript is a big thing. Yes it may be useful, but I remember the equivalent appearing on the ST scene a long time ago. GEM has had the ability to record events from the start, you can even have the mouse wandering around the screen if you want. It can be sort of neat to see things happening (ie: menus dropping, windows opening, apps starting etc. etc.), but you'd have to have a very repetitive life for it to be useful.

As far as I can see, it's a cross between a CLI and an event recorder/ dispatcher, but I think I already said that.

Simon.

>very clunky. Applescript can be the same, but given it's by Apple, I bet
>they'll forget the damn powerful part and just make it Damn clunky. That's
>the Apple way...

UNIX is "clunky"? DOS is "damn powerful"? I have trouble with both
statements.

UNIX is very powerful, not clunky at all, and very hard to use for beginners.
(Maybe you mean "sophisticated" or "difficult" when you say clunky).

DOS is not very powerful. In fact it's scripting capabilities are fairly
horrible. It is easier to use that UNIX, but also more clunky. (i.e.
I interpret clunky to mean it takes more commands and more work to do
what you want). There are a lot of simple things that to do in DOS
you would need to write a program, but you *should* be able to do in the
batch file.

Applescript is fairly bizaar. It uses a somewhat english-like language.
(Things like "Tell Microsoft Word . . .").

Applescript does a lot of wierd things that could be very powerful. You
can have applescript tell a scriptable program to open a document and
print it, or to sort a certain database, etc. This sort of functionality
is not really possible in UNIX or DOS. On the other hand, you loose all
the normal CLI stuff. Applescript essentially just lest you tell
applications to do stuff. There are not currently many "applets" or
small programs to use in the Applescript language. (There are some).

Isn't this an Atari newsgroup? The CLI supported by NEODESK is not too
bad. But overall, scripting on an ST isn't a real amazing thing. (At least
what I have done). However, if you run a shell in MiNT, you can get a
lot of cool UNIX like stuff).

Peter,
Why do you keep bragging about running a word processor, a comm program, and a organizer at the same time? We can do this on the Falcon easily (with MTOS, Geneva, or Mag!c). In fact, you could be doing this on a 4 meg ST, a computer from 1985, and you would have saved quite a bit of money on your computer purchase. Also, you're right (for once) that the Atari doesn't have Pagemaker or Photoshop. I guess that's why we have to settle for Calamus, Pagestream, DAs Layout, Studio Photo, True Image, and DAs Picture. You have stated before that you have not used an Atari so why make claims that you could never back up? The Atari has wonderful software.

By "clunky" I mean compared to a GUI. I have to do more to tell a CLI to do something than I have to tell a GUI (most of the more comes from remembering which switch, error checking my typing, typing it over again when I don't catch a mistake, etc.) ANd, with input/output redirection you can do most of the "telling an application to do something" if it supports it.

As it is, I think, and have thought since I first heard about it, that Applescript will be vastly underused and will probably fade. And, I am very happy that Apple is doing it. The more money they throw at silly projects (Newton, Voice recognition) the less they have for other things, and the more likely that they'll dump their collective selves in a hole, do the world a big favor, and go out of business. :)

Before this rumor goes any further, here are the facts.

FACTS:

1. CodeHead has NOT "left the market".

2. CodeHead no longer has regular office hours.

3. Messages left on our answering machine will be returned as soon as possible.

4. Our office manager Tomas is no longer working for us. There is no longer enough business to employ any office workers.

5. CodeHead is not developing any new software at present. This fact has been true for well over a year now.

We don't want to give anyone the impression that we are a thriving business. We've always been very upfront about our activities. However, we have not closed our doors either, and all of our products are still for sale. Bear in mind that many smaller Atari software companies have operated this way for years.

Try 'Amiga incorporated' (If the management at C= UK are successful in
their bid for C= international). Besides, theres a fair number of 040 A4000s
already out there, 3rd party companies are making 040 cards for the 4000/030
and you can still buy from existing stocks of A4000/040s if you are lucky.

Anyway, you don't NEED an 040 to catch up with Quadra 'performance'. Just
get an old ST or A500 and you can enjoy a similar level of day to day useability.

Gavan.

You mean a $200 M-peg board comming out this September doing full motion video, 24 bit color. Apple's R&D wants again brings out value like the $1200 33mhz with fpu, 040. The Falcon can't compete with this beast.

No, its Atari that will be out of business because the Jagflop flopped. Users are staying with Nintendo and Sega and are not buying the Jagflop.

The 040 Amiga costs many times more than the $1200 33mz.040 Quadra 630(PCI mac upgradeable). Add an extra $200 this comming September for the M-peg card doing full motion video and 24 bit color. No Amiga can touch this beast in it's price range.

Peter, noone in the Atari or Amiga usergroups gives a FUCK how competitive
the price of a Mac is. People with Ataris or Amigas have them because they
are _home_ computers - real 'Personal Computers'. The Mac is primarily aimed
at a buisiness market and guess what? When you put it up against it's main
business computer rival, the PC, it starts to look very lame indeed. Thats
why the PCs have stomped all over it. If you want to argue about the pros
of a Mac then go to an IBMPC .advocacy group. Of course, then you
wouldn't be able to claim it had better software support, more sales or
cheaper hardware. Which I suppose is why you always annoy the Amiga and Atari
groups. Just get a life....

BTW As with most of your posts, the new material to quote ratio was very
low. Try to improve the substance of your posts if you insist on polluting
these groups. Having endured over a year of your inane 'Apple price list
posts' I think most people have formed the impression that you are just
a mindless dickhead.

He's living in a slightly modified version of reality so it's no problem for him to go and not go at the same time.

Can we talk about Apple serial ports and how Apple only guarantee them up to 9600 baud? My apparantly crap Falcon goes to 150,000 or somesuch daft speed. Yeah! Let's start a my serial speed is faster than yours thread.

Really? Many ST owners leaving E-mail with their jaws hanging that this Mac
costs this low? Many ST oweners have ditched their poor excuse of a machine.
Many Amiga owners as well have ditched their poor excuse and have upgraded
because they got tired of just running an OS that allowed you to formatt a disk
and play an Atari 2600 style game..

I can't speak for peter personally, but his posts seem to confirm that. Just
what did he mean by playing an Atari 2600 "style" game?? Could be tempest
2000, for that matter. Is he implying there's something wrong with "pong"??
;)

>Your just pissy, that know one(almost) is buying your crap about a machine that

Sorry if it sounded like I was jumping the gun on the CodeHead's death - however, I was just relaying what I had heard and I did take care to mention that the CodeHeads were not developing any new software in my previous message.

I probably made the mistake of assuming that this in itself meant the end of CodeHead Software - which from Charles F. Johnson's post, it isn't.

Still, it doesn't sound too good...and honestly I can't blame you guys as you are talented programmers and the Atari market just can't support you anymore.

Many ST and Amiga owners _have_ sadly ditched their machines due to
the incompetance of the companies which make them, however they're NOT
moving to the Mac. It's the PC which is getting the disaffected Atari and
Amiga market. Frankly, the only possible reason for getting a Mac is that
you are too stupid to understand how to use a real machine or OS.

For the record, I've used several sorts of Mac at work. I don't like the OS. They are too slow given the processor they have, the serial speed sucks, the networking software is flaky, the stupid floppy system sucks. The basic hardware is cheap but the software isn't, neither is the overall cost of ownership.

I use a Mac at work too (I'm using one to type this post) and I
agree completely with your comments. When I got a 33Mhz 040 Quadra
650 to use I thought "great! A 33Mhz 040 machine will really kick ass!"
but the speed of use is very dissapointing. Also, although it has 8
megs its not really enough - 16 would be a lot more useful.

Appletalk is pretty dodgy, it's caused extra hassle since everything
else runs TCP/IP. It's also rather slow and tended to chew net bandwidth
until we got a structured cabling system in.

Any Atari or Amiga user wanting to use all the apps that idiots like
Sincrap are always blagging about only has to get a suitable emulator
and they can run them ON THEIR OWN MACHINE.

Apart from the personal machine issue, this is what Macdorks always
seem to fail to understand - you can run mac software on an Amiga or Atari
simply by getting an emulator which in many cases will enable your
machine to run substantially faster than the 'emulated' mac (unlike the
PPC emulations which run SLOWER than existing macs). It was pointed
out that the emplant on the 25Mhz 4000/040 only gave 20Mhz 040 mac
performance, but then the 4000/040 as shipped by commodore has a
pretty awful memory setup which slows it considerably. I'd say that
an Amiga with 40Mhz 3rd party 040 card will outperform ANY Mac for
running 68k mac software, even more so if you use one of the 3rd party
gfx cards like Retina.

If Mac owners want to impress Atari or Amiga owners then they will
need to show that owning a Mac will mean:

Having a better OS (System 7 - ha ha ha)
Being more efficient with resources (3 megs for OS is a no no)
Offering decent multitasking (back to system 7 again)
Offering better programming tools (on a Mac??????)
Offering better os documentation (this just gets better....)
Having more decent games (ever see a Mac run Stardust?)
Being a better platform for
FSF software like GNU C++ (The FSF don't much like the mac)
Having more affordable software (I don't think so....)

Being a better platform for
learning about computing (you'll learn FA about computers
by using a Mac)
Having a more flexible machine for
the home (ever try plugging a mac into a tv?)
Having an affordable platform you can
upgrade as you can afford (don't even LOOK at anything less
than a 25Mhz 040 with 8megs RAM
and a monitor capable of 800x600
if you want a Mac)

Lets see if sincrap can point out mac superiority in any of these fields...

Software is rediculously expensive, unless you can get an educational
discount, but that's true for most IBM software too. The difference with
IBMs being that there's a lot of cheap software available, while there
isn't much cheap stuff for the Mac.

I'd also like to add that for normal screen redraws (the grow box and
shrink box, esp.) my 68000 MSTE is as fast as or faster than an 25MHz 040
Mac. This when comparing the two in 2-bit (black and white) graphics
modes, with Warp9 v3.75 installed on the MSTE. I'd love to see how a
Falcon with NVDI compares. If Apple really wants to be competitive with
Microsoft, they should spend a year optimizing their code; I figure if they
optimized only 20% of the OS, even low end Macs would run as fast as high
end PCs. But maybe that's the whole point; if they did that then they
might not take in as much money, since people wouldn't buy as many of the
more expensive Macs.

FWIW,
Tom

Well I'm in the process of adding a DOS system, but I haven't switched
over. I found a very cheap motherboard at a clearance sale and decided
it would be fun to build a system. My main interest at this time is to
try out some new games (wing commander type games in particular). I still
use my Falcon and Mega for anything serious and will continue doing so
as long as they meet the need.

So far I don't see anything better about the DOS system other than the
massive support by everyone and there brother meaning I have more choices
than I know how deal with in terms of what hardware and software to buy.
I guess this is a good thing, but I can't afford to buy it all anyway so
it is not helping me do anything more than I can already do with my Ataris.

As for Mac, well I use one at work and really have no interest in coming
home to one.

Despite what Apple _wishes_ the Mac is not, never has been and, in all
probability never will be a bussiness computer. Right now, about 75% of
Macs are sold to the education market. While I would never use a Mac myself
and would only rarely recomend one to friend, I do have to admit that this
does make some sense. For some kinds of multimedia applications (specificaly
ones that are used for teaching) Macs probably present better price performace.
Low-end wordprocessing, (i.e. papers for school) is another thing Macs are
good at. While I would want a PC for DTP work, a bottom of the line Mac
delivers as good or better performance for churning out a simple paper and,
given educational discounts costs less. This is a large niche which the Mac
can and should fill. The ST/TT/Mega/Falcon, is unfortunatly, dead.
I do not own an atari computer but I am thinking of buying a used one.
Personaly, I think, that in their day, the ST and Amiga should have both
beat out the Mac. The amiga, it seems, suffered from lousy marketing while
the Atari line seemed to have been destroyed because nobody would take
a computer from "that old videogame company" seriously.
Ok, I'll stop rambling.

The cheap IBM software tends to both cheap in price and in quality.

I hope that when Apple introduces the new micro-kernal based OS in 1996 the
efficiency will sky-rocket. I hope that right now apple is designing the hell
out of the micro-kernal OS and they will use two full years to get it to work.
I still think that Apple should release intermediate upgrades like 7.5 and 8.0
to ensure that developers will only have to make small changed to be 9.0
compliant.

N.B. 8.0 and 9.0 where arbitrary assignments that I chose.

So your going to spend $1500 for an A4000/030 plus $1500 for a decent 040 board
plus memory and additional HD space. Plus $600 for Emplant and roms.
I would hope your $3000 plus setup would out perform $1200 Q630.

> Having a better OS

Your OS is only capable of formatting a disk and playing an Atari 2600 style
game. The Amiga OS does not do much with the ease of System 7 does.

> Being more efficient with resources (3 megs for OS is a no no)

Hi powered apps which is lacking on the Amigaflop and STflop reqire more memory
like the Toaster does. Thats why the Mac comes standard with 8 megs of ram.
Adding a an additional eight megs and ramdoubler would still be cheaper than
A4000 set up.
> Offering decent multitasking (back to system 7 again)

You mean formatting a disk and playing an Atari 2600 style game at the same
time. I am using my bro's new Duo 230($899 from MacWarehouse) which is using
the Chinese version of System 7(Chinese characters). Very impressive. Can the
Amiga os do that. My A1200 did not have that option.

> Offering better programming tools (on a Mac??????)

I suppose you do not get a MacWarehouse catalog.

> Offering better os documentation (this just gets better....)

Selling point, eh?

> Having more decent games (ever see a Mac run Stardust?)

Subscribe to MacGames, you will be surprise. Lots of shipping native games
at MacWorld.

> Being a better platform for
> FSF software like GNU C++ (The FSF don't much like the mac)
>

Like this is a selling point to the hundres of million of non programmers.

Having more affordable software (I don't think so....)

I suggest you get the MacWarehouse catalog.

> Being a better platform for
> learning about computing (you'll learn FA about computers
> by using a Mac)

What does that mean? Being proficient in the workings of Apps.

> Having a more flexible machine for
> the home (ever try plugging a mac into a tv

Your scraping the bottom of the bucket. With Apple's new inexpensive video
card, that can be done.

?)
> Having an affordable platform you can
> upgrade as you can afford (don't even LOOK at anything less
> than a 25Mhz 040 with 8megs RAM
> and a monitor capable of 800x600
> if you want a Mac)
>

You can't get anything less an 040 - 25mhz, except for the Performa 550. The Mac platform is a lot more affordable than the Amiga one.

Q605 logic board upgrades cost $599 for LCII and III users. The New PPC proocessor upgrade board costs $599 to Q630, LC475, Q605, LC575, P550, P575 and so on.

The PowerBooks will get $900 replacement PPC logic board upgrades.

> Lets see if sincrap can point out mac superiority in any of these fields...
>

One thing you left out is serious apps. Oh, I forgot this is a programming machine. You have high expectations that anyone who wants to own a PC has to be dedicating to programming. It's like me to say that I think people should vote when they turn 18.

Wake up and smell your arm pit and get back to reality.

As usual you completely failed to grasp the post. Maybe I was being too
technical for you? AS I SAID, its caused hassle since its proprietary (and
therefore incompatible with the more standard TCP/IP) and also its slow and
grabs large chunks of your memory bandwidth. I wasn't talking about ease
of filesharing.

> Making excuses that you do not have decent apps.

We HAVE decent apps, it's just that we can run ALL your Mac apps
if we like _as well_. Saying the Mac has such and such an app and we
should all buy macs is pointless because (a) The sort of apps the Mac
has are generally of little use to home computer hobbyists and (b)
if we really want to run it we just get an emulator and run it, no hassle.

> So your going to spend $1500 for an A4000/030 plus $1500 for a decent 040 board

Standard 8 megs? not around here they dont. And if you NEED to put 8 megs
in just to make up for a memory hogging OS you are throwing money down the
drain.

> > Offering decent multitasking (back to system 7 again)

I suppose Lightwave, Real 3d , Scala etc arent serious? If you mean
things like industy word pros, databases etc then the logical machine to
get for these is a PC......

Now just how much use is having the system font in Chinese!!?!
Unless of course you are Chinese, but I'm sure English/American is going
to be enough for 99.99% of users.
And just what is a 2600 style game?

>> Having a more flexible machine for

Where the hell did you get the idea it is just for programming!?!
If you want "serious" apps try Calamus or Pagestream for DTP. I'm sure
there are lots of others, I just haven't ever used them, so I can't
comment on them.

If they are giving away $800 worth of software away free, they must be
making a huge profit normally. This is what is meant by expensive
software. Much more expensive than it needs to be.

>Read above...

Don't be stupid, Peter. I didn't say that top-of-the-line apps cost much
more for Macs than they do for PCs. I said that if you want to get a task
done, you can do it on a PC with a $10 DOS app, or on a Mac with a $50+
app. Try reading more carefully next time.

>> I'd also like to add that for normal screen redraws (the grow box and

>
>Are you running comparable apps? Hey My Apple IIC ran faster than the ST.

Compare basic Finder screen redraws to GEM Desktop redraws, or any basic
opperation like opening and closing windows! The 68000, 16MHz MegaSTE with
Warp9 installed is as fast as or faster than a 25MHz 040 Mac. And just so
you don't forget, Sinclap, and start raving about difference in bit planes,
I compared them both in 2-bit color mode.

>Define expensive Macs? Do you mean a $1200 Q630(33mhz.040)?

Try a 33MHz 030 Mac for $1100 (with monitor and software). If Apple really
had their heads screwed on tight, they'd have those inexpensive Macs
running as fast as a 486DX2 66 for average opperations like word
processing, small spreadsheats, databases, mail lists, etc. The average
home user could get two or three times the bang for their buck if Apple
would optimize their OS, or let someone else do it for them, and this would
mark Macintoshes as the home computer of choice. For more computationally
intensive applications, people could still go with the 040s or with the
PPCs, but they wouldn't - and shouldn't - *need* them just to get decent

performance out of a Mac.

FWIW,
Tom

Pete,
If so many more people are switching from Ataris to Macs instead
of IBMs (as your messege implies) then why is there an Atari
emulator (actually two that I know of) for the IBM yet none
for the Mac. Oh wait.... it is probably because the Mac couldn't
handle it :-). On the other hand, Spectre 3.1 is out and
available.... of course, I would much rather use Atari software
anyway....

You are confusing AppleTalk and LocalTalk. If you want TCP/IP, then MacTCP
is available; it will become part of the standard System Software as of
System 7.5.

>> Any Atari or Amiga user wanting to use all the apps that idiots like
>> Sincrap are always blagging about only has to get a suitable emulator
>> and they can run them ON THEIR OWN MACHINE.

>> an Amiga with 40Mhz 3rd party 040 card will outperform ANY Mac for
>> running 68k mac software, even more so if you use one of the 3rd party
>> gfx cards like Retina.

I thought Atari advocates claimed that they didn't need a Mac because of all
the great software they had?
I don't know about any Amiga emulators, but for the Atari, the only emulator
is Spectre GCR, which emulates a Mac Plus. It doesn't do colour, and it is
incompatible with System 7, which means it's pretty useless. There is a lot
of software which either requires System 7 or loses functionality if it's
not there.

Can you produce any benchmarks to substantiate your claim that an Amiga
emulating a Mac is faster than the equivalent Mac?

>> If Mac owners want to impress Atari or Amiga owners then they will
>> need to show that owning a Mac will mean:
>>
>> Having a better OS
>> Being more efficient with resources (3 megs for OS is a no no)

Like TOS? When you install MultiTOS, SpeedoGDOS and all the other programs
that will provide the Falcon with the same functionality as System 7, your
OS memory requirements will be pretty high. (Some functions, such as
QuickTime, don't even exist on the Atari!) I'd hardly call TOS efficient --
this is the OS that requires programs such as NVDI and Warp 9 to get it up
to an acceptable speed.

As for System 7.5 taking up 3Mb of memory ... it doesn't, not unless you have a bunch of extensions loaded that hog memory. I'd say that most Mac users have System configurations which take less than 2.5Mb of memory.

>> Offering better programming tools (on a Mac??????)
>> Offering better os documentation (this just gets better....)

This is an outright lie. Don't try to fool me on this one -- I *have* the Atari Developer kit, and it is garbage. Half the documentation is outdated material from the original Digital Research version of GEM. They provide Alcyon C as a language!

Contrast this to the widely available Inside Macintosh series, which is excellent.

>> Having more decent games (ever see a Mac run Stardust?)

You must be kidding ... games, on the Atari?? Are there still companies that make games for the Atari?

>> Having more affordable software (I don't think so....)

You have to learn to shop around... I paid more than $200 for Calligrapher, and I got a slow, buggy program with bad documentation. Is that what constitutes "affordable?"

>> Being a better platform for
>> learning about computing (you'll learn FA about computers
>> by using a Mac)

What is this supposed to mean?

>> Having a more flexible machine for
>> the home (ever try plugging a mac into a tv

This is idiotic. Have you ever tried displaying 640x480 on a television? Nobody in their right mind wants to waste their TV by using it as a very-low-quality display for their computer! That went out with the demise of the 8-bits.

>> Having an affordable platform you can
>> upgrade as you can afford (don't even LOOK at anything less
>> than a 25Mhz 040 with 8megs RAM
>> and a monitor capable of 800x600
>> if you want a Mac)

You are unclear as to your meaning. I can upgrade my Mac if I want to. There are tons of accelerators, cards, software, etc. out there.

I will grant you the fact that the A1200's coprocessor chips speed it up,
but there is *NO* way -- ABSOLUTELY NO WAY -- that a 16MHz 68020 can outperform
a 33MHz 68040 with FPU.

What $10 DOS applications are there? No shareware, please...

>>> I'd also like to add that for normal screen redraws (the grow box and
>>> shrink box, esp.) my 68000 MSTE is as fast as or faster than an 25MHz 040
>>> Mac. This when comparing the two in 2-bit (black and white) graphics
>>> modes, with Warp9 v3.75 installed on the MSTE. I'd love to see how a
>>> Falcon with NVDI compares. If Apple really wants to be competitive with
>>> Microsoft, they should spend a year optimizing their code; I figure if they
>>> optimized only 20% of the OS, even low end Macs would run as fast as high
>>> end PCs. But maybe that's the whole point; if they did that then they
>>> might not take in as much money, since people wouldn't buy as many of the

>Compare basic Finder screen redraws to GEM Desktop redraws, or any basic
>opperation like opening and closing windows! The 68000, 16MHz MegaSTE with
>Warp9 installed is as fast as or faster than a 25MHz 040 Mac. And just so
>you don't forget, Sinclap, and start raving about difference in bit planes,
>I compared them both in 2-bit color mode.

First of all, in the above quote you first claim "2-bit black and white"
(which makes no sense, as 2-bit colour would be a 4-colour display) then you
claim "2-bit colour." Which is it?

Second of all, your difference is unfair because GEM uses byte-aligned
monospaced fonts, which can be drawn quicker. the Finder uses proportional,
variable-sized fonts. Try this instead: Using your MSTe in 640x400x1 and
a 25MHz Mac in 640x480x1, redraw two reasonably similar screens filled with
various sizes and styles of proportional fonts, and some graphics. Then
see which is faster.

Third of all, certain visual effects on the Mac, such as scrolling and
the zoomrects upon opening and closing a window, are timed so that they take
the same amount of time regardless of the computer you are running. THis
was included because when the Mac II came out, the 68020 in it was so much
faster than the previous 68000 that text whizzed by too fast to read when
it was scrolled, and other visual effects went by too fast to see.

Fourth of all, you had to buy a separate program to get decent performance out
of your MSTe. I had an MSTe, and I know for a fact that it is unusable without
Warp 9 because of the slowness.

>Try a 33MHz 030 Mac for $1100 (with monitor and software). If Apple really

>intensive applications, people could still go with the 040s or with the
>PPCs, but they wouldn't - and shouldn't - *need* them just to get decent
>performance out of a Mac.

If an optimised OS is what will makes a computer the home computer of choice,
and if TOS is as optimised as you claim, then how come the Falcon isn't
selling like hotcakes?
And where can you find a 33MHz 68030 Mac any more?

The Amiga must be a breeze for operating a network, than despite the lack of a
built in ethernet port and system software. So how does the above difficulties
have to do with individual users? It's not like I have a network system at
home.

Define computer hobbyist? Add an emulator to an already expensive machine.
The Mac Dos compatible Q610 costs $1300. You remember the 486 Houdini board?
I don't know why amigas are expensive. If the overprice A4000/040 came down to
a grand, I would consider a Toaster set up.
>
>> So your going to spend $1500 for an A4000/030 plus $1500 for a decent 040 board

I don't think so if you are running a 100K shareware on your A1200 versus
photoshop on the Quadra.

Thats all you can do with it. This OS has nothing in it. Can your OS switch
from Chinese native to US and back forth. The Mac is indeed a very global.

In the US it is. Compare features on the Mac OS versus 2.X on the amiga. The
Toaster locks up the Amiga OS. You can't multitask when running the Toaster.

Are you referring that the Mac does not have an IBM Emulator? Does the $400
486 Houdini board come to mind? Mac users have no need for an ST emulator.

>Are you referring that the Mac does not have an IBM Emulator? Does the $400
>486 Houdini board come to mind? Mac users have no need for an ST emulator.

Read again, Peter. I understand Scott's post to mean that if so many more
people are switching from Atari to Mac instead of to IBM, why isn't there
an Atari emulator for the Mac? There is certainly a market for one in the
PC world, and I know I would be (and several other people are) interested
in one if I switch from Atari to Mac, so why hasn't anyone made one for
Mac? Lack of market, perhaps? Could it be that more people are switching
from Atari to IBM than from Atari to Mac?

And you're wrong about Mac users not needing an ST emulator. If I buy a
Mac with a $400 ST emulator, I could save myself several hundred dollars in
software (I wouldn't have to buy Pagemaker, or a graphics program, or a
label maker, or a chess game, or...).

You may have no need of an Atari emulator, but then you've already admitted
to not knowing the first thing about Atari software, how well it works, how
inexpensive it is, or anything else about anything that doesn't say "For
Macintosh."

In message <CuE89D.FGp@ecf.toronto.edu>, pischke@ecf.toronto.edu (PISCHKE DAVID) writes:

In response to my post,

>What $10 DOS applications are there? No shareware, please...

I could list 40 or 50 of them, if I went to a local computer store and wrote down titles, but suffice it to say that almost the entire "My Software" series runs in the $10 to $20 range, plus tons of word processors, label makers, address books, invoice makers, resume kits, etc. And those titles which used to sell for $40 or $50 which are now sold in software bins for $5 (some of it actually good stuff) could be listed by the truck load.

In response to "first" and "second," I was talking about black and white modes on each computer, excuse the confusion. I still don't see why things like opening and closing windows should take longer on an 040 Mac than on a 68000 MSTE.

>Third of all, certain visual effects on the Mac, such as scrolling and

Well that explains some of it. Apple would rather a speedy PowerMac look and feel just like a pokey Mac 256? That's my kind of computer, all right. Make me wait to open a window just so we all have time to reflect on the good ol' days...

>Fourth of all, you had to buy a separate program to get decent
>performance out of your MSTe. I had an MSTe, and I know for a fact that
>it is unusable without Warp 9 because of the slowness.

Very true, but my point is that the seperate program (for which no counterpart exists on the Mac) makes my computer faster than most Macs for the everyday, basic use (word processing, telecomm, some DTP, and programming) that I put it to. This shouldn't be possible, not when the 040 Mac is running at something like 30 times the MIPS (if I remember right, the 68000 is about 0.8MIPS, and the 68040 is about 24MIPS).

>If an optimised OS is what will makes a computer the home computer of
>choice, and if TOS is as optimised as you claim, then how come the Falcon
>isn't selling like hotcakes?

This question is irrelevant (Atari never really marketed the Falcon, so why would anyone buy it?). The point was not that Falcons should be selling, but that the average home- or small bussiness-user should be able to get speed performance of a 486DX2 66 out of an 030 Mac, which would cost close to $1000 LESS than the Intel-based machine. This alone would be a major selling feature (at least for most of the people I know). For high-end graphics, CAD, or any really computationally-intensive application, a machine with raw computational speed would be needed, but for the average user, 3D modelling isn't a big priority. Not having to wait to scroll through a multipage document, on the other hand, is a priority; the less time it takes, the better the person will like the machine (I've sold lots of Macs doing such comparisons).

>And where can you find a 33MHz 68030 Mac any more?

Ever heard of Performa or LC 460, 600 or 550? These are still selling, and the former two are current models in the Macintosh line.

Regards,
Tom

Do you know for sure that more people are switching to the PC? Have facts to
back it up?

As for the Atari Emulator, ask Dave Small to develop one if there is a market.

Than why would you buy a Mac than? What would you run? As for Desktop
Publishing, the $49 Aldus Home Publisher is excellent. If your needs are met
by these Mac programs and new versions of your Atari library are not comming,
than you may have to make the switch eventualy.

I could list software that I bought for $12.99 from MacWarehouse that are
listed upto $99.00.

DayMaker 3.0 in the catalog is $79 but bought for $12.99.
Super Seven Utilities $12.99
T/maker clip Art $12.99

I could list many more. Whats the catch? Everytime you order from MacWarehouse
regardless of amount of order, you are eligible for a list of software selling
at promotional price of $12.99. Can even order a box of $5.00 disks to get the
deal. The List changes daily.

The Performa 550 is the only 030 in Apple's current desktop line. This can be
had for $1599 at your local Wal-Mart. Imagine a Machine with a fast 030, 160
meg HD, dual speed cdrom, 26dpi trintron monitor, 16 bit color and sound with
bundled software and cdrom titles costs only $300 more than a Falcon without
monitor, cdrom drive and software. If you were a consumer which one would you
buy?

Of course I would "have to make the switch eventualy." But I'm sure that I, like most Atari users, don't particularly relish the thought of shelling out a bunch of cash for programs when the old ones do just fine. I would switch to Mac for a few very specific reasons, and make certain that I had software to satisfy those reasons, but if the rest of my Atari software was still satisfactory, I wouldn't want to replace my entire software library if I could just buy an (ultimately cheaper) emulator to run it. My comms package works great; my label makers are just fine; lots of software doesn't need to be replaced, even if I switch to a Mac. Replacing the comms software alone would cost at least a hundred dollars. You see my drift? I might buy a Mac, but even if I have the money to replace all of my software, why spend it if there were a less expensive alternative?

Getting back to the point all this stemmed from, what is the ratio of Atari->IBM to Atari->Mac converts? It would seem that, given the Atari emulators on the IBMs satisfy the above paragraph, you would expect that if there were so many Atari->Mac converts there would also be an Atari emulator on the Mac. There isn't, so either there is a gaping hole in the market, or the market just isn't as big. Which means there are more people who switch from Atari to IBM than from Atari to Mac. I don't have figures, but this was all speculation from the start, and you had seemed to miss the point of it. I hope this clears things up.

Regards,
Tom

> System 7.5.

No I'm not. Appletalk is a protocol that runs over the network. It's
seperate from TCP/IP and works in a completely different way. If offers
something like a max rate of 384K/sec. Unfortunately, as well as being
incompatible with TCP/IP it's also rather an inneficient user of bandwidth.
(fits in with the rest of the Mac system in that respect). Until we
segregated the Apple workgroups on a hub the Appletalk traffic was
causing major problems for other network users. You can of course get
TCP/IP but you must still use Appletalk for sharing volumes, printers etc.

and yes, yes system 7.5. Looks like its not only MS Windoze users who
have to look constantly to the next release of their OS.

> the great software they had?

I can't speak for Atari owners but I'd imagine that like Amiga owners they
are happy with the software available for what they want to do. For a home
user , ability to run industry standard software is of minimal benefit. Of
course, if I _really_ wanted to run the industry standard software I would
get a PC compatible as THEY are the industry standard.

> I don't know about any Amiga emulators, but for the Atari, the only emulator

The Amiga has AMAX and Emplant. Both run system 7, the Emplant will do it in colour up to whatever resolution your Amiga/gfx card will support. Emplant will also multitask mac and amiga simultaneously. Plus it offers localtalk ports if required.

> Can you produce any benchmarks to substantiate your claim that an Amiga
> emulating a Mac is faster than the equivalent Mac?

A recent review of Emplant on an A4000/040 25Mhz showed that using Mac benchmarks, it was slightly faster than a 20Mhz 040 Quadra. However, the 040 card in the 4000 is another C= screwup and 3rd party replacement and piggy back cards will speed this up from 150% onwards. When they first review AMAX they showed that on a 25Mhz A3000 it outperformed a Mac with the same speed/processor at everything but gfx redraw. Drop a retina board in and you get faster gfx than a 'real' mac.

I was thinking more of AmigaDOS. It whips System 7 in every respect thats important to me and other home users. The Falcon has MiNT which is a unix-a-like OS. I'd take that over system 7 any day too, though I'm not impressed with the GEM GUI.

> As for System 7.5 taking up 3Mb of memory ... it doesn't, not unless you have
> a bunch of extensions loaded that hog memory. I'd say that most Mac users

My mac at work hovers around 2.9 - 3.0 meg ram for the system. Even 2.5 meg is unacceptable for the home user - why pay for RAM that you're never going to get to use????

> >> Offering better programming tools (on a Mac??????)

> material from the original Digital Research version of GEM. They provide
> Alcyon C as a language!

Apple have never released the full OS details of the Mac. They've kept it a closed system. As usual, they use the courts to enforce their proprietary architecture. Theres full OS and Hardware Docs for the Amiga, at least, in the ROM Kernal manuals et al. Plus both the Amiga and Atari have lots of 3rd

Party compilers available which are better than any I have seen for the Mac: Lattice/SAS C, Manx C. Not to mention the latest in the GCC C++ compiler. Oh, and user-orientated programming languages like STOS/AMOS and Blitz Basic just don't exist for the Mac.

> Contrast this to the widely available Inside Macintosh series, which is
> excellent.

> >> Having more decent games (ever see a Mac run Stardust?)

> You must be kidding ... games, on the Atari?? Are there still companies that
> make games for the Atari?

The Atari games market is weak, but still there. The Amiga market is strong with excellent titles available. Many home users enjoy playing games and its another good reason to get a home computer.

> >> Having more affordable software (I don't think so....)

> You have to learn to shop around... I paid more than $200 for Calligrapher,
> and I got a slow, buggy program with bad documentation. Is that what
> constitutes "affordable?"

Most of the much vaunted Mac software is tagetted at business with prices to match. Atari and Amiga software is made for the home user and is priced accordingly. Mac software is generally a LOT more expensive.

> >> Being a better platform for
> >> learning about computing (you'll learn FA about computers
> >> by using a Mac)

> What is this supposed to mean?

People like to play around with their machines - pushing them to the limit, learning the OS. Most 'experts' in business these days learned about computing on their home machines.

If you can't understand that, then it's no wonder Mac advocates constantly completely miss the point when posting their price listings. If you are not interested in programming/hobbyist computing then go post your crap in PC groups which will be more than interested to hear your claims of 'more software' and cheaper machines......

> >> Having a more flexible machine for
> >> the home (ever try plugging a mac into a tv

> Nobody in their right mind wants to waste their TV by using it as a very-low-
> quality display for their computer! That went out with the demise of the
> 8-bits.

Not idiotic at all. What home user in their right mind is just going to spend thousands on a Mac/PC setup with keyboard/box/monitor? Amigas and Ataris have low end machines which are compact units which can be plugged into a TV . Much more friendly to the home user. They can of course be

upgraded later if the user requires and they have the funds. As usual,
Mac advocates miss out the fundamental point that Atari and Amiga are
HOME COMPUTERS - aimed at the individual home user rather than your
corporations. I wouldn't tell business users to get an Atari or Amiga -
that would be just as stupid as your attempts to tell us to get a Mac.

> >> Having an affordable platform you can
> >> upgrade as you can afford (don't even LOOK at anything less
> >> than a 25Mhz 040 with 8megs RAM
> >> and a monitor capable of 800x600
> >> if you want a Mac)

> You are unclear as to your meaning. I can upgrade my Mac if I want to. There
> are tons of accelerators, cards, software, etc. out there.

As I say above, you can buy an Atari or Amiga as a low-end config and still
get real use out of it. Then upgrade it as your needs grow. The Mac is so
poorly designed you MUST buy a top-end config to be usable. Not a problem
for businesses, but a major disincentment for home users.

I really don't understand how Mac owners can be so blind. The Mac is
a corporate and business machine, its competing against the tide of PC
compatibles. It **will** lose as its such a minority machine in a
market that wants compatibility. As a buisness machine it has less
software and support than the PC.

As a home machine, it is laughable. Its expensive and the software is
oreiented to corporate use. It doesnt have any of the properties that
typical home users would want.

As such, its caught between two stools with Apple trying frantically
to sell the Machine by slashing prices and introducing over-hyped PowerMac
boxes. Go on Apple, see if you can keep your grip on the 20% of the market
you hold. I'll enjoy gloating when I see Apple go down.

NO! Appletalk is a network protocol. Jeez, a mac owner who doesn't even
know about the technical aspects of his own machine comes to a group that
comprises mainly technical minded people and tries to spoof about technical
details to them.

No wonder Mac owners have a reputation as being computer-illiterate idiots
who cant handle more than one mousebutton.........

> I cannot comment on those Applications since I have never heard of them.
> I assume they are graphics applications...

Yes, graphics and MultiMedia apps. You haven't heard of them, you probably don't want or need them, fine. Try and understand that most people here don't want or need your Mac applications. Even if we did, we'd get an emulator and be able to run them just fine on our machines.

If you can't post things that are relevant to this newsgroup then don't post at all. If I wanted a Mac pricelist I'd pick up a computer catalogue. (This mainly applies to Sincrap who constantly just posts quotes and prices, here and in amiga.advoacy too...)

At last! A sensible comment! How many people DO have a network setup at home?

The key here is ***** H O M E ******** . All the 'advantages' enjoyed by the
Mac over the Amiga and Atari only apply for corporate use. For H.O.M.E. use,
the Amiga and Atari are much better bets..... Maybe we're starting to get
through that thick skull of yours. Whats it composed of? Compressed Mac
Warehouse catalogues?????

I'd only buy an emulator if I needed to. As a home user, I don't need to
but I do know amiga users who used a Mac and work and would like to be able
to use software to do work from home also. Since they already had good Amiga
systems, for only a couple of hundred extra they could have full macintosh
(dis)functionality. We already have systems we like, its just that WE have
the option to use all Mac software for a couple of hundred bucks if we so
desire. (which personally, using a Mac at work, I DONT)

> Thats all you can do with it. This OS has nothing in it. Can your OS switch
> from Chinese native to US and back forth. The Mac is indeed a very global.

My OS (AmigaDOS) has full locale support built in. I can switch the whole system
between any one of several supported languages with a menu selection. Chinese
however is not one ;-) I suppose that since the mac can do this, I can just
set my Mac Quadra at work to do it? Tell me Peter, what menu selections must
I make to do this? I haven't seen the option on any of the Apple menus .. I mean,
it is built in to the OS isn't it? I suppose I'll have trouble figuring out all
the chinese characters that will appear on my screen but I'm sure I'll manage.

Come on, tell me how. I genuinely do want to see this feature thats built into
the Mac Quadra that I use. I knew that those 3 megs of RAM going to the OS had
to be used for something, and now I know that they will let me see the
desktop in Chinese.....

If so many more people are switching from Ataris to Macs instead
of IBMs (as your messege implies) then why is there an Atari
emulator (actually two that I know of) for the IBM yet none
for the Mac.
...
-scott tirrell

Probably because the developer is a real PC fanatic.

I would pay for a MAC ST emulator but ONLY if it did midi.

Pete,
You miss my point. You seem to want people to believe that
Atari users are switching to the Mac in droves (those thousannds
of e-mail messages you have, right?). If this is so, why is it
that IBMs have Atari emulators but Macs do not? It is probably
because there is a market for Atari emulators in the IBM world.
Are you saying that all those ex-Atari owners want to throw out
all their old software? Oh.... I forgot.... Mac software is so
inexpensive :-). Might as well buy Pagemaker to replace that
copy of Calamus, right?
In another messege you state something like: "those buggy apps."
What bugs do Calamus ad Pagestream have? I am sure DMC would like
to hear your problems so that they can fix them.

Tom,
First of all, as far as emulators go, I think that the argument from Atari users is "why tell us about all the Mac apps when we can run them anyway?" For me, though, I'd take Atari apps over Mac equivelents anyway (less expensive!).
Also, MultiTOS is a pre-emptive multitasking operating system whereas System 7 is cooperative. Compare resources between System 7 and Geneva for a fair comparison. Also, MultiTOS is not needed to use my system. In single-tasking mode I can cut down OS memory usage to nearly nothing giving me all of my memory. Can I do this with a Mac if I want to run one memory-hungry program?
All this talk about NVDI is quite unfair (I do not have it for my Falcon, BTW). If I want to word process I just throw the resolution into 640 x 480 x 2. Why would I need 256 colors to word process?! The Falcon in monochrome is speedy!
Yes, there are great games for even the Falcon. Look at Multi-briques, Transartica, Ishar (1 to 3), Starball, Street Fighter 2, Oxyd. Let's face it.... even the older Atari games blow away new Mac action games (Llamatron anyone?). Of course, you can play great repetitive CD-ROM games like 7th Guest (lucky dog :-)).

Pete,
One big mistake that you make is that you claim the Falcon comes
with no software. How about Atariworks, SAM, D2D, Breakout,
Landmines, MultiTOS, SpeedoGDOS? Or do these not count?
You're right, BTW, about what computer consumers will buy.
It doesn't mean that it is a smart choice, IMO. BTW, how
much memory does this Mac have? Remember, you said that Macs
come with 8 megs of RAM standard so I am assuming that it does.

: 15% market when they could move to the intel 80% market.

Actualy, the Mac market share is more like 10% and the Intel share more like
90% About 80% of macs are used in education (school owned, owed by full time
students or full time teachers). ST and Amiga together make up 1 or 2% with
a current market share of some fraction of 1% for the ST and nothing for
the amiga. I have not seen an ST except when I almost bought one about
five years ago.

I think I explained why in my second point, which you deleted -- as I said,
try timing redraws of two screens filled with multi-style, multi-size
proportional fonts and graphics on your MSTe and Mac, instead of comparing
byte-aligned monospaced text on your MSTe and multiple proportional fonts and
graphics on the Mac.

>cost close to $1000 LESS than the Intel-based machine.

Why do Atari advocates seem to think that software optimisation can solve
the problems of the world? No matter how much you optimise your software,
there is a limit to how fast you can make your algorithm. Making a 33MHz 030
run at the speed of a 66MHz 486DX2 is next to impossible.

>Ever heard of Performa or LC 460, 600 or 550? These are still selling,

If I don't need to see what the screen is doing (like the zoom rects), then sure, why not speed them up, or eliminate them all together if you wouldn't see them anyway? What little processor time they take could be better applied to more necessary tasks. For instance, opening a directory window takes a fair amount of time; there are times when I know where the file that I want to open is, but I have to wait for even a small window to draw before the Finder will register a double click. By optimizing the process, we would be able to work a little faster and with few pauses caused by the OS.

It depends on what you're doing. MSDOS or Windows really bog a processor
down. For most home users, the everyday tasks they do are not heavily
dependent on the processor's raw speed, but on the OS's handling of those
tasks. i.e. scrolling through documents, launching apps, opening windows,
etc. I didn't mean to imply that an 030 Mac could be optimized to perform
the same number of MIPS as a 486DX2. What I did mean was that if the Mac's
OS was optimized, it would compare favorably, from the perspective of the
average home or small bussiness buyer, to PC systems costing a thousand
dollars more. This would obviously increase Apple's market share, at least
until Microsoft got around to optimizing their OS in response.

I'm curious... does Mac do Hebrew? And if it does, does it change the orientation of its drop-down menus to right-to-left? Does it change the orientation of the window gadgets?

Interesting to note, Atari's have Hebrew letters in the system font.

A friend of mine iw working on writing a Game for his Atari. When he finished the first version, it was great and could do about 15fps on the graphics it was doing, even though no use would possibly push that speed limit (it's a maze game).

Nevertheless, he spent some time and the code probably does in excess of 60fps, even though it doesn't need it (yet).

You'll NEVER find a Mac programmer putting that kind of effort into his program. If he can get it to work at 3fps and sell it for $400, then he's done with it.

That's what's so great about Atari software. The developers actually care about writing good code and aren't lazy Mac and PC morons who tell you to get a faster machine because they can't program worth shit.

You probably won't like to hear this, but rumours are that System 7.5 (Due out in a month) has been optimised and is quite a bit speedier. I do not claim that System 7.1 has be optimised as much as possible -- but then again, neither has TOS!

Yes, this has always been a problem with Atari's GDOS; it's why Codehead came out with G+Plus. From what I've heard, SpeedoGDOS 5 doesn't slow the system down.

Yes, I've heard these rumors also, and that System 8 (due out in a year or so, I think) will be even more optimized (and completely PPC native!). Of course, they're so large that you probably won't be able to run them effectively on a 030 (read: inexpensive) Mac, but I look forward with hope to finding out how much work Apple has put into its code.

Of course, Microsoft has said that Chicago has been optimized enough that it will be able to emulate older machines/OSes as fast as or faster than the originals. Or so rumor has it. I personally dislike Microsoft and hope this isn't so, but we'll see...

So faster means 80% of the speed? If you buy a new piggy back card for your
Amiga and it speeds your computer up by 150% then you are at the speed of
a 30MHz 040 mac. Then you need a new board for gfx redraw. I think that
a A4000 + Emplant + Piggy Back + Gfx card would be more expensive than a
mac with a 33MHz 040. You would really NEED to run amiga software to make
this worth it.

>just don't exist for the Mac.

I don't know what you mean by never releasing the full OS details of the Mac. Do you want source code or what? What do you means by them using the courts to enforce their 'propriety architecture'. I also do not know what you mean by 'full OS and Hardware Docs'. What would 'full OS and Hardware Docs' consist of exactly? Source code? Schematic diagrams? As far as I know there are 3 commercial c/c++ compilers for the macintosh. Two of the compilers offer graphical interface builders and application frameworks and I don't know about the third. GCC C exists for the mac but I can't comment on it since I've never used a freeware compiler before.

> The Atari games market is weak, but still there. The Amiga market is strong
>with excellent titles available. Many home users enjoy playing games and its
>another good reason to get a home computer.

True, but the mac probably has more games than the Amiga and the Atari.

> Most of the much vaunted Mac software is tagetted at business with prices
>to match. Atari and Amiga software is made for the home user and is priced
>accordingly. Mac software is generally a LOT more expensive.

What about software like Claris works. For $199 you get everything that you need for home use.

> People like to play around with their machines - pushing them to the limit,
>learning the OS. Most 'experts' in business these days learned about computing
>on their home machines.

How do you push a computer to it's limit? Learning the OS is fine, I know a lot about system 7. I don't see how your last comment is relevant.

> If you can't understand that, then it's no wonder Mac advocates constantly
>completely miss the point when posting their price listings. If you are not

>HOME COMPUTERS - aimed at the individual home user rather than your
>corporations. I wouldn't tell business users to get an Atari or Amiga -
>that would be just as stupid as your attempts to tell us to get a Mac.

I would rather have a good monitor than a fast CPU. Any home user/programming/ hobbyist is going to be glaring a his screen for hours on end wondering why his loop isn't working since he unrolled it. A good screen, I find .26mm

dot-pitch adequate, is important if you are trying to minimize eye strain.
Oh, my mac does have RCA jacks in the back so I can use it as a display or
watch TV on my monitor. I do the latter far more than the former.

> As I say above, you can buy an Atari or Amiga as a low-end config and still
>get real use out of it. Then upgrade it as your needs grow. The Mac is so
>poorly designed you MUST buy a top-end config to be usable. Not a problem
>for businesses, but a major disincentment for home users.

As long as you buy a make with at least one slot then you can upgrade it. As
for poor designed, didn't you say '040 card in the 4000 is another
C= screwup'? It seems that C= are designed poorly but what, specifically, is
wrong with the design of the mac?

> As a home machine, it is laughable. Its expensive and the software is
>oreiented to corporate use. It doesnt have any of the properties that
>typical home users would want.

It has a user friendly OS and cheap work packages.

> As such, its caught between two stools with Apple trying frantically
>to sell the Machine by slashing prices and introducing over-hyped PowerMac
>boxes. Go on Apple, see if you can keep your grip on the 20% of the market
>you hold. I'll enjoy gloating when I see Apple go down.

The mac has less than 20% of the market. Apple expects to acheive 20% of the
market in two years.

Interesting. Why is the WIndows version $100 cheaper??

Answer: Because Mac users are _still_ willing to stupidly pay more for the
same thing??

So much for cheap Mac software...

p,.s. you get Quicken with the Windows Claris WOrks too...

Gee, you have to replace the A4000' 040 board with the warp one. You have to pay for C='s screw up. An over price $2500 Amiga 4000/040 with sufficient memory and HD space needs a $1000 plus Warp board to get it right. I was scrounging through AmigaWorld at the news stand today. Boy its getting smaller despite costing $3.95. Can this wapping $3500 Amiga outperform a $1600 Powermac 61000 running native apps? I think not...

Anything that Jim Drew is worth a grain of salt. apparently Jim was using his
old bag of tricks by setting the Amiga/Emplant to 2 bit color mode and the mac
to it's full color capabilities. My brother had a A4000/Emplant system, he
said it is dog slow and buggy. For the cost of Emplant and roms, a Q605 can be
had.

I think not. Amiga game development has slowed dowm. Most games are for the
low res A500 and A2000. I know, I had a A1200. Amiga games use to be great,
but not true today.

Gavan you are an idiot. I suppose those Atari and C= machines are still
selling in great numbers. You don't know what home users want.. Your still
thinking of the early '80's. The Mac Performa line is intended for the home
market. The Local Wal-Marts have the Performa 500 series that come bundled with
lots of programs and cdrom titles.

>
>> >> Having an affordable platform you can

The Mac is also a home machine. Ever heard of the widely successful Performa
line?

> As a home machine, it is laughable. Its expensive and the software is
> oreiented to corporate use. It doesnt have any of the properties that
> typical home users would want.

You are that clueless. Apple has sold gazzilions of Performas to the home in
1993 as well as '94' Because the performs has exceeded sales forcast, Apple
will increase the number outlets by another 6000 in the USA. This is according
to Apple USA.

Are you sure that's the street price? The educational price for Claris Works is $99 for the mac and I suspect that you are quoting the educational price for the Windows version. Yes Quicken is bundled with Claris Works; on the Macintosh Performa models the two are bundled with the computer.

Side Note: Why are you flaming me? We where having a rational discussion here when you started using the word 'stupid'. And I've NEVER seem anyone mangle someone else's sig.

I never said thousands of E-mail addresses. I got at lest 20 E-mail messages
inquiring for info. As for Pagestream, its very buggy. My brother had a
A1000-A4000 and stated that Pagestream is buggy. I not aware that calmus is
buggy. I understand that Calmus has been ported to Windows NT.

Making excuses that the Falcon is not speedy in 256 color? 16 bit color is the
standard on the Mac. You can switch to Black and white mode if its desired.
As for memory hungry programs on the Mac, eight megs is the standard and
coupled with Ram Doubler, its not an issue anymore.

There are great games on the Mac. Look at rebel assault(cdrom), Falcon and F18.
I suggest you get INside Mac Games.

I jumped the gun on standard memory. A 605 4/160 software bundle(Claris Works, Quicken) costs $900 plus $150 for four meg board. Add Ram doubler for $50 you have a 16 meg system. this price is cheaper than the $1300 Falcon 4/80. I understand you realy need 14 megs to run MultiTos correctly. Source: Current notes when the falcon was previewed.

Atariworks does not compare to ClarisWorks which is constantly being improved.

Can you get a Falcon Performa at the Local Wal-Mart and Best Buy? Perorma 550 at $1599 puts the $1300 Falcon with out Cdrom, 26 dpi trinitron monitor, eight cdrom titles to shame. Plus Apple has a 800 number for warranty support like sending out a technician and or picking up your machine. Plus there will be a PPC board. What about the Falcon: last of the atari line and no support. If you call up Atari for repairs, Sam Tramiel will laught at you and say Sucker!!

Who ever takes over C= should think about starting production on the A4000. To lower production costs and have more units on the market, the A4000 should come with out the processor and HD. The price should be $700. This would alow for easy custominization and lower the entry price for a Toaster system.

Considering that a 1200 could have been had for $300 with a processor, I
think your number is high. Figure that a 1200 less the 020 and plus a better
case should be around $400. Add a 060 processor and a nice-sized SCSI HD
and the 4000 might even be a competitive machine, eh?

The 65,000 came from Atari. 3do sales are much higher like 150,000 at last count.

Atari has lost the window of opportunity to sway Nintendo and Sega users. Both of these firms are each sellling millions of consoles each year and maintaining their customer base. So you think Nintendo and Sega have had not the months of experince of developing their next consoles. You are deluding yourseld. Both of these firms have billions in sales each year. Both spend more on R&D than Atari's entire sales many times over. When these new consoles come out, both firms will be launching on all cylinders of marketing and development. The Jag will be pushed to the sidelines. This is the truth...

Considering who ever takes over production will most likely have limited
resources for manufacturing. Since the cpu daughter board is widely reported
as a kludge and with other third party options, this would be a good idea.

: easy custominization and lower the entry price for a Toaster system.

I've been proposing this sort of thing for quite some time....

A4000T MB in a PC Tower case, shipped from CBM sans everything - let
people buy the computer they really want. I find it annoying to buy an
A4000T, only to have to turn right around and replace the CPU card with
one worth haveing (WARP! :)

And while they're at it, a slightly revised A1200 - call it the A1300
or something. Put in 68030 and 68882 PGA sockets, and XTAL sockets, and
standard 72 pin SIMM sockets. Then people can pick they
speed/features/cost they want/need.... From a EC030 @16 up to a 030/882
@50 - all with not only a lowwer overhead for CBM, but also *much* more
flexibility for the end user....

You know, the Amiga *really* needs to broaden it's product line, has
for a long time. There's just too much price difference between the
A1200 and the A4000, not to mention that the line doesn't go up high
enough.... Obviously, enough people want/need more powerful Amigas,
enough to pay the extra cost/hassle of buying the 3640 board, and then
replacing it.... The solution of simply leaving out the CPU, FPU, XTAL, RAM,
HD, and moniter and just having standard sockets would help solve both
the problem of lowering overhead and development time for CBM *and* the
problem of broadening the Amiga product line....

Of course, if AAA is really going to ship, then don't bother with the
'A1300, but still, ship the A4000s and A4000Ts *without* the CPU cards!

: Quicken) costs $900 plus $150 for four meg board. Add Ram doubler for $50 you
: have a 16 meg system. this price is cheaper than the $1300 Falcon 4/80. I

Your reference to RAM doubler is invalid. The Atari manages memory
properly, while the Mac does not, so for the Mac to effectively use 8
megs, you need a hack (RAM Doubler). Ram doubler does not give an 8 meg
Mac 16 megs. It lets an 8 meg Mac come close to almost properly using 8
megs.

And seeing as how Atari programs are less than a quarter of comparable
Mac programs that often have fewer capabilities, I'd have to say that a
2meg Atari will get along better than a 16meg Mac.

: understand you realy need 14 megs to run MultiTos correctly. Source: Current
: notes when the falcon was previewed.

I don't know what Current notes said, but I've used MultiTOS and I've
programmed MultiTOS. I have 4 megs of RAM, and while running quite a
number of apps at once, I have never run out of memory. I hear that
MultiTOS runs just fine with only 2 megs (which makes sense, considering
that's about 16 megs for a Mac).

On the other hand, a Mac runs out of memory just by loading the Operating
System. Very sad.

: Atariworks does not compare to ClarisWorks which is constantly being improved.

This is true. Atari Works sucks.... but it's version 1.2. IF the were
to improve it as far as Claris works has been improves (how many
versions/revisions has it been through?), then I'm sure it would compete
well.

: Can you get a Falcon Performa at the Local Wal-Mart and Best Buy? Perorma 550
: at $1599 puts the $1300 Falcon with out Cdrom, 26 dpi trinitron monitor, eight
: cdrom titles to shame. Plus Apple has a 800 number for warranty support like

: sending out a technician and or picking up your machine. Plus there will be a
: PPC board. What about the Falcon: last of the atari line and no support. If
: you call up Atari for repairs, Sam Tramiel will laught at you and say Sucker!!

I do not find Mac's at WalMart, and the ones I see at places at CompUSA don't even run properly. I can't get things like Quicktime to work, and neither can the salesmen. I never was able to get the PC emulator to run on the PPC Mac, and neither could the salesman.

And as usual, I was sickened at how slow the 040 and PPC Macs run. Sure, the could scroll in windows fast, but that was about it. The display drawing speed (of windows, screen fonts (which were pretty lame too), and other things) was horribly slow.

In fact, when I finally got quicktime to work on one of the 040 Macs, I saw what I usually see... the sound came in short bursts, and the video was running at a very slow, UNEVEN frame rate. It's bad enough to watch something run at slower than 10fps when the frame rate is consistent, but when the frame rate varies, it really makes me want to puke.

: I thought Atari advocates claimed that they didn't need a Mac because of all
: the great software they had?

We don't. Often, we emulate another computer just to show off. To show
that we can do it, that it works, and that it's faster, more reliable,
and less expensive than the real thing.

: I don't know about any Amiga emulators, but for the Atari, the only emulator
: is Spectre GCR, which emulates a Mac Plus. It doesn't do colour, and it is
: incompatible with System 7, which means it's pretty useless. There is a lot
: of software which either requires System 7 or loses functionality if it's
: not there.

I've used Macs before, so I'm not too saddened by Spectre being out of
date. I don't want to use a Mac. Like I said, we do it primarily to
show off.

: Can you produce any benchmarks to substantiate your claim that an Amiga
: emulating a Mac is faster than the equivalent Mac?

: >> If Mac owners want to impress Atari or Amiga owners then they will
: >> need to show that owning a Mac will mean:
: >>

: >> Having a better OS
: >> Being more efficient with resources (3 megs for OS is a no no)

: Like TOS? When you install MultiTOS, SpeedoGDOS and all the other programs
: that will provide the Falcon with the same functionality as System 7, your
: OS memory requirements will be pretty high. (Some functions, such as
: QuickTime, don't even exist on the Atari!) I'd hardly call TOS efficient --
: this is the OS that requires programs such as NVDI and Warp 9 to get it up
: to an acceptable speed.

Install MultiTOS, SpeedoGDOS, NVDI, and all that other stuff, and not
only does it not come close to require 2 to 3 megs of RAM, but it makes
the machine faster, more reliable, and nicer to use than a Mac.

And TOS is often faster than a Mac WITHOUT graphics accelerators. We
use graphics accelerators to get faster still. Plus we get spoiled by
how fast the Atari's are and want to get even faster.

: As for System 7.5 taking up 3Mb of memory ... it doesn't, not unless you have
: a bunch of extensions loaded that hog memory. I'd say that most Mac users
: have System configurations which take less than 2.5Mb of memory.

Even 2 megs is a joke. NO OS should take up that much memory! No OS
should require more than about 200k... TOPS. I do that just fine on my
Atari... in fact, I require less because my OS is in ROM. I don't have
to waste RAM by putting an OS in it... I can use it for other things.

: >> Offering better programming tools (on a Mac??????)
: >> Offering better os documentation (this just gets better....)

: This is an outright lie. Don't try to fool me on this one -- I *have* the
: Atari Developer kit, and it is garbage. Half the documentation is outdated
: material from the original Digital Research version of GEM. They provide
: Alcyon C as a language!

Who uses the Atari developer kit? Certainly no Atari developer. Some of
us get it just in case we missed something, but otherwise, we can get
along great from using other people's books, like the Atari Compendium.

: Contrast this to the widely available Inside Macintosh series, which is
: excellent.

And everything written in Pascal. Thanks, but no thanks.

: >> Having more decent games (ever see a Mac run Stardust?)

: You must be kidding ... games, on the Atari?? Are there still companies that
: make games for the Atari?

Have you seen any of our most recent PD games? They're better than most
of your commercial games that cost a lot of money!

: >> Having more affordable software (I don't think so....)

: You have to learn to shop around... I paid more than $200 for Calligrapher,
: and I got a slow, buggy program with bad documentation. Is that what
: constitutes "affordable?"

Better than $500 for some of the Mac's crappy software.

: >> Being a better platform for
: >> learning about computing (you'll learn FA about computers
: >> by using a Mac)

: What is this supposed to mean?

Mac is a computer-knows-best, wipe-your-nose-for-you, we're-all-morons
type of computer. You are completely isolated from the real computing
going on, and also restricted from it. You won't learn a damn thing
about REAL computing from using a Mac. You'll just get frustrated from
trying to use its slow interface and limp-wristed software.

: >> Having a more flexible machine for
: >> the home (ever try plugging a mac into a tv

: This is idiotic. Have you ever tried displaying 640x480 on a television?
: Nobody in their right mind wants to waste their TV by using it as a very-low-
: quality display for their computer! That went out with the demise of the
: 8-bits.

We use it for things like video production, which you can't do nearly as
well or easily on a Mac.

: >> Having an affordable platform you can
: >> upgrade as you can afford (don't even LOOK at anything less
: >> than a 25Mhz 040 with 8megs RAM
: >> and a monitor capable of 800x600
: >> if you want a Mac)

: You are unclear as to your meaning. I can upgrade my Mac if I want to. There
: are tons of accelerators, cards, software, etc. out there.

We don't really need to upgrade our Atari's. This isn't a cop-out when
you consider that a Mega STe (which is upgradable, BTW), does most things
faster than an 040 Mac.

You are isolated from the computer whenever the interface is more than a
mechanism for poking hex values into memory locations and branching to
memory locations.

> You won't learn a damn thing
>about REAL computing from using a Mac.

What's real computing. Is it using spreadsheets and using word processing which is most of what computers do? Or is it about configuring software and learning file systems?

>You'll just get frustrated from
>trying to use its slow interface and limp-wristed software.

Many people don't get frustrated by what you claim is a slow interface and limp-wristed software.

>We use it for things like video production, which you can't do nearly as
>well or easily on a Mac.

My computer came (stock) with a S-video input port, a S-video jack output jack, a sound in jack, a sound out jack and two monitor plugs (one can accept monitors with their own speakers and/or mics). Not a bad stock system for video editing eh? Of coarse apple sells professional systems as well.

That is not fair---My office is buying apple macs as opposed to PCs because they are fairly well intergrated units. PCs are notorius for rampant hardware and software incompatabilities and needing a lot of set up time. To be quite frank I have my hands full with this constelation of Suns and need plug-in-and-play.

I would, of course, buy TTs or Medusae for the office but the built in networking of the Macs (and my directors experience with Macs) has convinced me otherwise.

I don't think we should think of Macs as poor choices just because a dickhead like Sinclap is advocating them---though it was enough to make me think twice.

I mean 'throwing money down the drain' in the sense that you are spending money
os hardware that you don't actually need to spend. I don't give a damn how cheap
a Quadra is compared to an A4000 since my A1200 does all I want, faster than a Mac
Quadra and for HALF the price of a Quadra. Why are you advocating the Quadra
anyway? I thought the PPC Macs were supposed to be the way to go? Anyone who buys
a Quadra will find very shortly their computer is obsolete .. well, according to
Apple. Wasn't it only last year that you were spouting your shit about the supposed
super-duper AV macs? Where _are_ they now.......????????

> Those programs require a memory investment Gavan.

At least I only have to buy memory when apps require it. I don't have to buy wodges of memory JUST TO RUN THE OS. And 8 megs of RAM isn't standard on Apple machines in Europe .. try 4 megs on the 68k line and 8 megs on the PPC line. Virtually all serious Mac software requires a memory expansion too - I wouldnt even say that 8 megs is enough if you're trying the pitiful process that passes for multitasking on the Mac. Oh, and make sure your PPC has at least 16 megs just to run the shitty 286 emulation that comes with it......

> this worth it.

You think any would buy the 3rd party accelerators and GFx cards just to
run a faster Mac emulation? You buy this stuff to give extra oomph to the Amiga
and you can _also_ get the benefits when running any Mac stuff. Since Amiga
software ALREADY outperforms Mac Quadra performance on the existing 4000/040
then I'm not worried. Of course, its not just the hardware design of the Mac
that makes it slow, the OS must take a lot of the blame too and even under
eumlation you are still running that slow inneficient mac os.....

> never used a freeware compiler before.

Apple keep the programming details of their OS secret. Some years ago, a bunch
of dissaffected Mac OS programmers tried to break this by distributing OS source
and docs to a number of different media organisations .. Bzzzt! Major lawsuit
threats by Apple kept the whole thing under wraps...

The Mac is NOT an accessible machine. It's DESIGNED to prevent users from
playing around with the system software and hardware. It insulates the user from
computing and the cost is crap perfromance.

> > The Atari games market is weak, but still there. The Amiga market is strong

i
ROTFL! Get real..... Wheres all the action games? A few adventure and strategy
games don't make a large software catalogue. The Mac has useless games support
compared to the PC or Amiga!

3299. MacMiNT

Newsgroup: comp.sys.atari.advocacy
Date: 1994-08-15 10:52:18 UTC
From: Iain.Laskey@barclays.co.uk
Message-ID: <32nhd2$2n8@bognor.barclays.co.uk>
Source record: 16098

MacMiNT is a port of MiNT ie the current version of TOS on the ST series, over to MACs. This achieves several things. Firstly it's a well supported (by users), full pre-emptive O/S with many of Unixes features including mountable filesystems, pipes etc. Secondly, it has masses of GNU support in the form of MiNT aware shells, utilities and tools that can make use of it. It will not allow you to run GEM apps, just TOS or MiNT ones.
The fact that many Mac users are so interested in it as a development environment and are putting so much time and effort into the port must say something about native Mac OSs and development environments....

I don't think you can really complain about .advocacy groups. By
definition they are going to be largely full of crap and flames. If
you _pay_ for a usenet connection then it's best to avoid these
groups. Problem is that Sincraps (and other such posts) often end
up in other groups too. Maybe try posting a followup which redirects
all subsequent followups to 'alt.flame' or something.

> This man is desperately trying to become Atari's own Sinclap.

He has a valid point. Most Mac and PC Windoze (especially PC) software
these days is very inefficiently coded since the developers know that
they can rely on users having a fast CPU. It means they can shorten their
development time (higher profit margins). Its bad news for the users
since they end up paying MORE for hardware to run their software without
seeing much of a speed benefit. Plus, it forces older users to upgrade
as they soon find their old 386's or whatever can't cope.

Of course, technology marches on but I'd like to see new hardware
being put to use running more powerful, functional programs instead of
helping the software companies make more money.

Ludo says: way to go scott. We ain't no underdog in DTP! No sir!
Now that amiga is gone, it seems that some apple freak sees ATARI
as a new potential enemy, for else why would mister what's his name
worry about even logging in to the newsgroup and brag about his ma-
chinery. How nice it may be, this SIG was created for atari-fans,
that want to read about new developments or solving of problems of
their machines. Hearing some news in this SIG from other brands
than ATARI is fine to me, it keeps me informed and broad(er) minded.
I don't say apple sucks or other crap (it's a fine machine (and I have
worked with it (emulation, but that is good enough for me)) and other
people would't say so either. My computer runs and so do apples I presume.
Ain't we all brand-lovers?
There are other nice(r) machines, but, read my lips, we LOVE ATARI,
and thus defend it against other offenders!
Please stop this apple-talk unless it is usefull and not flamable,
oke? If talking about it, don't offend or defend, just state your facts..

Thanx my friend (s), see you later!

Just learned to read and write have we?
Let's try this again. It should read:

'They are much better than Atari. Atari are crap.'

Note the use of the word 'are' to make the first sentence grammatically correct. Then, rather than a comma, use a fullstop to seperate the statement into two sentences. Note also that Atari should be capitalised.

Finally, whilst the grammer was generally very poor, the factual content was also rather low and needed somewhat more information to form an argument of a cohesive nature that we can base our ensuing conversations on.

Of course I picked three really bad word processors -- because you implied
that all Atari programs were good, because Atari developers "write good code
and aren't lazy!" I disproved you by mentioning three programs which are
utter garbage.

>Now let's talk about the countless more bad WP's for the Mac......

Of course, you should realise that due to the fact that there are more word
processors for the Mac, period, that statistically there are bound to be more
"bad" word processors. I can't think of one as bad as Wordflair II, though.

Your reference to NVDI is invalid. The Mac draws to the screen properly,
while the Atari does not, so for the Atari to effectively use its CPU,
you need a hack (NVDI). NVDI does not give an Atari a fast CPU. It lets
an Atari come close to almost properly using its CPU.

Once again I do not understand what you post. My brain is obviosly bad at
parsing posts :) Aren't you playing around with the system software everytime
you drag a window? I have a feeling that you mean something else though. What
does insulating the using from computing mean? And why is it bad? Should the
user see the currently executing machine code, register status, etc in a
window or something?

>ROTFL! Get real..... Wheres all the action games? A few adventure and strategy
>games don't make a large software catalogue. The Mac has useless games support

I don't know anything about pure shoot 'em up games since I don't really
like those but here are some games in categories that I do like. I know their
are a lot of strategy and adventure games but that's ok since they are my
favorite after flight sims.

First Person: Marathon, Pathways Into Darkness, Sensory Overload
Flight: Falcon,Hornet,Hellcats, Chuck Yeager Flight Simulator,(some heli game)

Could anyone who posts to this group make sure that the use less than 78 characters per line. This will make it look good when posted and when it is (inevitably) followed-up. Also could you remove the lines from the post that you are not directly addressing as well as lines other than the ones contained in the last follow-up? I know that this is all basic net etiquette but I thought it would be worth the band-width to mention it again.

Apple has various multi lingual versions of System 7. If you want Hebrew,
Chinese, French and German whichare free on Macs sold in those countries. For
people such as students who are majoring in those lingual languages than those
options of adding the capabilities are an option. To answer your question
Gavan, you have to pay for it.

Gavan, I am managing quite fine in a four meg config. I have WriteNow, Zterm,
dayMaker and Falcon loaded at the same time. Yes, Word is a memory hog, but
you have alternatives. The Amiga is no different than the Mac. The Toaster
needs a minimum of 10 megs to get started. Many of your high powered animation
and graphic apps need lots of memory(Source:friend who owns a Toaster, who
concedes that a PowerMac would be nice with a future Toaster).

Off topic here, sort of. The September issue of AmigaWorld is getting smaller by the month. Well anyways, when I was brousing through it(I refuse to spend the $3.95 cover), my jaws dropped when this canadian Mail order is advertising an A1200 system for $1999 which includes 340 meg hd, and monitor. What are they thinking? The new Performa 630 with monitor and scads of software can be had for $1499 and has a future..

-Peter
-MacWarehouse:Duo230 4/80 - $899 plus $3.00 next day shipping..

: Show me a benchmark where a TT comes ahead of a Quadra 650 in a benchmark
: running macintosh software.

I don't have benchmarks, but I've seen it done. The speed difference was
noticable.

: >Install MultiTOS, SpeedoGDOS, NVDI, and all that other stuff, and not
: >only does it not come close to require 2 to 3 megs of RAM, but it makes
: >the machine faster, more reliable, and nicer to use than a Mac.

: How come SpeedoGDOS is an addition and RamDoubler is a hack. Seems like a
: double standard to me (I beleive that you said that in another post).

Because RamDoubler was written to correct a FLAW in the design of the
Mac's OS. SpeedoGDOS is a module that adds scalable fonts. This has the
clear advantage of allowing you to not boot with it if you don't need it
and need the RAM for something else. Here, we have two places where
Atari memory management is clearly superior.

: >Even 2 megs is a joke. NO OS should take up that much memory! No OS
: >should require more than about 200k... TOPS. I do that just fine on my
: >Atari... in fact, I require less because my OS is in ROM. I don't have
: >to waste RAM by putting an OS in it... I can use it for other things.

: You must hate NeXTStep. It takes up well ober 2Mb RAM and has a huge
: disk requirement.

Anything unix-based is almost absurd. On the other hand, it's a real OS
with good memory management and other such niceties, plus it's built for
huge networks and interfacing with the Internet. The Mac's OS is huge
without these features. Very bad.

: >And everything written in Pascal. Thanks, but no thanks.

: Everything is not written in Pascal. The calling conventions are in pascal.

Just as bad. Plus, the whole OS was written in Pascal, a language that
doesn't lend itself to efficient object code. The design of the language
sacrifices efficiency (in both size and speed) for structured design.
I'm sure the Mac OS could (in theory) be easier to maintain than one
written in C, but it's a tradeoff I'm not willing to make, plus, as bad

as the OS obviously is, the programmers don't even know how to program
Pascal well.

: >Have you seen any of our most recent PD games? They're better than most
: >of your commercial games that cost a lot of money!

: Haven't seen your recent PD games? Have you seem are most recent commercial
: games?

I've glanced at a few things. The price tags usually is what turns me
off first.

: >Better than $500 for some of the Mac's crappy software.

: If you spend $500 on crappy software then you are a moron no matter what
: platform you use.

This is true, but for the Mac, you're restricted to bad software.

: >Mac is a computer-knows-best, wipe-your-nose-for-you, we're-all-morons
: >type of computer. You are completely isolated from the real computing
: >going on, and also restricted from it.

: You are isolated from the computer whenever the interface is more than a
: mechanism for poking hex values into memory locations and branching to
: memory locations.

: > You won't learn a damn thing
: >about REAL computing from using a Mac.

: What's real computing. Is it using spreadsheets and using word processing
: which is most of what computers do? Or is it about configuring software
: and learning file systems?

Both. The problem with Mac software is that the attitude behind the
computer is to have the computer do all the thinking for you, and this
annoys the crap out of me.

: >You'll just get frustrated from
: >trying to use its slow interface and limp-wristed software.

: Many people don't get frustrated by what you claim is a slow interface and
: limp-wristed software.

Most of the people who have used something decent like an Atari are
frustrated when they have to use a Mac.

: >We use it for things like video production, which you can't do nearly as
: >well or easily on a Mac.

: My computer came (stock) with a S-video input port, a S-video jack output jack,
: a sound in jack, a sound out jack and two monitor plugs (one can accept
: monitors with their own speakers and/or mics). Not a bad stock system for
: video editing eh? Of coarse apple sells professional systems as well.

Mac is no good for video processing. The OS gets in the way of any
processing that requires a lot of system time, and the I/O hardware slows
down the CPU.

I have never seen a quicktime player that played faster than 15fps. And
I have never seen a quicktime player that played with a constant frame rate.

: had for $1499 and has a future..

Has a future of being obsolete. The performa 630? Which one is that? Let me pull out the directory of all the ridiculous apple models and look... heh. The performa has about as much future as those compaq presarios, they're cheap stripped down models of a computer made for entry level users, and they're intentionally slow and weak so that the new buyer has motivation to upgrade later on. To say that the performa has a future is to overlook Apple's new policy of putting out 3 new models every minute, confusing even the best dealerships and causing a lot of stocking and ordering problems for themselves. At the rate that Apple is laying off employees, they don't look too shiny right now, and all their good apps are being ported to the PC, so why buy an apple at all? The apple used to be a sort of a renegade machine, one for people who were afraid of DOS, but it's looking more and more like the competition every day. Now it's a big faceless company that tries to convince everyone that they're too stupid to use a computer and that they need Apple to hold their hands so that they can figure out how to use a word-processor. At least CBM never tried to convince me that I was stupid; they made a lot of bad business mistakes, and I'm no fan of their management, but they never used fear and intimidation to sell their product. The "I'm too stupid to use a computer" theme that Apple has been playing on for so long has done a lot more harm to the world of computers than good. At one time, every machine you bought at least came with a command line and a programming language (even if it was only basic), but now most people have been convinced that they are "too stupid" to ever handle something like writing their own useful programs. The big-business corporations have pulled the control out of the users hands, and that's really sad. Think how much more people would actually be able to do with their computers if Apple hadn't gone to all that trouble to scare them...

anyhow, the performa is a shit machine, I'd rather have the 1200. The only performa models I've seen were dog-slow and too weak for any of the wonderfully bloated applications on the mac. If you want photoshop or fractal painter, you'd be much better off with a 486 than a performa. Perhaps Apple left the "nce" out of the name "performa" because it would have been false advertising to claim that it actually had any sort of performance...

RamDoubler corrects a memory flaw while SpeedoGDOS corrects a speed flaw.

>Anything unix-based is almost absurd. On the other hand, it's a real OS
>with good memory management and other such niceties, plus it's built for
>huge networks and interfacing with the Internet. The Mac's OS is huge
>without these features. Very bad.

The NeXTStep is better than System 7. I use a NeXTCube a school and the OS
is better than System 7 in almost everyway. But System 7 has features
similar to those of NeXTStep that make it better (feature wise) than
OS' that fit into 200K.

>Just as bad. Plus, the whole OS was written in Pascal, a language that
>doesn't lend itself to efficient object code. The design of the language

>written in C, but it's a tradeoff I'm not willing to make, plus, as bad
>as the OS obviously is, the programmers don't even know how to program
>Pascal well.

Actually, Pascal leads to better efficiency than C as far as object code
goes. A pascal compiler does not have to worry about functions that
can accept an indeterminant number of parameters. Pascal doesn't have to
worry about complex statements in for loops. Pascal also has a 'goto'
capability that makes writting unstructured code possible. C is actually
more structured than Pascal. The finder actually ballooned when it was
re-written in C++ and performed more slowly. The MacOS was originally written
in Pascal but most has been rewritten in C. Yes the OS is obviously bad
(pause as I throw my computer through a window) now I can run windows and
gain a huge speed increase!

>I've glanced at a few things. The price tags usually is what turns me
>off first.

I have an ST and a mac. Falcon for the ST cost me more than Hornet for the mac and Hornet is far better than Falcon. Which platform is screwing me?

>Both. The problem with Mac software is that the attitude behind the
>computer is to have the computer do all the thinking for you, and this
>annoys the crap out of me.

The computer should do as much thinking for me as it can. I'd rather not work at all and just have my computer do my job for me.

>Most of the people who have used something decent like an Atari are
>frustrated when they have to use a Mac.

I had an atari. Now I have a mac. I like it.

>Mac is no good for video processing. The OS gets in the way of any
>processing that requires a lot of system time, and the I/O hardware slows

OK, lets do a test. I'll digitize some a video sequence and compress the data using Cinepak. You can do the same and we'll see which is faster using stock computer components and software.

>I have never seen a quicktime player that played faster than 15fps. And
>I have never seen a quicktime player that played with a constant frame rate.

Sorry.

kind of tough on anyone stupid enough to buy one of the Original
powermacs, but not to worry, no doubt these will be outdated in a
few months too....

Why are you posting this crap? No-one cares less about product
release details.

And you sound like your usual 'heres a Mac price catalogue' self. I've had
enough of your purile posts in the various .advocacy groups. Since you
obviously can't string a cohesive arguement together or grasp some
technical basics I'm not going to waste any more of my time 'debating'
over the (in)accuracy of your posts.

Nope, I wouldn't define the OS as anything I'd like to use at home.
I don't think you can call an OS that doesn't have memory managment or
pre-emptive multitasking 'good', and the PC is a much better bet for
running 'industry standard' stuff. With 80%+ of the business market
its the machine to learn relevent skills on. PLus of course, although
Windows/DOS is undoubtably crap it does have some good alternative OSs
like OS/2 and Linux/X11.

> > You think any would buy the 3rd party accelerators and GFx cards just to

> How are you determining which out performs which?

USING the platform , day to day. The Mac feels sluggish and takes a
long time to perform simple tasks. My A1200 performs them quickly and
the OS is generally more functional.

> > Apple keep the programming details of their OS secret. Some years ago, a bunch

> available. You still haven't told me what you want as far as hardware details.
>i

The Amiga is much better documeted, ROM Kernal manuals and the like. How
much documentation has Apple published? I'd bet that most of what is
available is reverse engineered stuff. Anyone who has been exposed to
prorgamming will realise that the Mac is just about the WORST choice
for programming on.

> > The Mac is NOT an accessible machine. It's DESIGNED to prevent users from

> does insulating the using from computing mean? And why is it bad? Should the
> user see the currently executing machine code, register status, etc in a
> window or something?

It's bad because the Mac simply isnt good enough to perform the job
of insulating people from computing properly, in fact, nothing currently
available is. What I, and most Atari and Amiga owners want, is a REAL
computer that acts like one, not a system designed solely to be as easy
to use as possible for beginners. I use a Mac at work, I find the OS to
be slow and frequently unreliable and I wouldn't want to use one as a
personal machine. Thats the way 95% of non-Mac users feel. If you are
trying to push your Mac philosophy you are coming to the wrong place.

> >ROTFL! Get real..... Wheres all the action games? A few adventure and strategy

> First Person: Marathon, Pathways Into Darkness, Sensory Overload
> Flight: Falcon,Hornet,Hellcats, Chuck Yeager Flight Simulator,(some heli game)
i

First Person:
Dungeon Master, Chaos Strikes Back, Ishar 1,2&3, Eye of the Beholder 1&2,
Abandoned Places 1&2, Captive, Liberation, Labyrinth of Time....
Flight:
F-18 Interceptor, Gunship 2000, Thunderhawk, F-29 Retaliator, Combat Air
Patrol, F-117 Stealth Fighter, F-15 Strike Eagle, Tornado, knights of the Sky,
FS2, Av-8b Harrier....
Platform:
Zool 1&2, Rainbow Islands, New Zealand Story, Naughty Ones, Harlequin,
innumerable generic platform games.....

And so on with Action and Arcade games aplently. And strategy, and puzzle,
and driving, and sports sim.........

Not much of choice on the Mac now...?

>few months too....

Not to mention the 7100 and 8100 will be outdated by the middle of '95,
when Apple stops using NuBus expansion slots and switches to PCI. There
are lots of expansions available for NuBus now, but in a couple years,
it'll all be PCI, and then all those people who buy 7100 and 8100 this year
(not to mention most of the 680x0 Macs) will be SOL.

> Why are you posting this crap? No-one cares less about product

: I thought Atari advocates claimed that they didn't need a Mac because of all
: the great software they had?
: I don't know about any Amiga emulators, but for the Atari, the only emulator
: is Spectre GCR, which emulates a Mac Plus. It doesn't do colour, and it is
: incompatible with System 7, which means it's pretty useless. There is a lot
: of software which either requires System 7 or loses functionality if it's
: not there.

: Can you produce any benchmarks to substantiate your claim that an Amiga
: emulating a Mac is faster than the equivalent Mac?

: >> If Mac owners want to impress Atari or Amiga owners then they will
: >> need to show that owning a Mac will mean:
: >>
: >> Having a better OS
: >> Being more efficient with resources (3 megs for OS is a no no)

: Like TOS? When you install MultiTOS, SpeedoGDOS and all the other programs
: that will provide the Falcon with the same functionality as System 7, your
: OS memory requirements will be pretty high. (Some functions, such as
: QuickTime, don't even exist on the Atari!) I'd hardly call TOS efficient --
: this is the OS that requires programs such as NVDI and Warp 9 to get it up

: to an acceptable speed.

Compare the prices for the basic machines, compare the ouput from the
equivalent software and just revel in the satisfaction that you didn't
follow the sad, sad, crowd who said Macs are cool and FORK OUT SHIT
LOADS OF MONEY for a piece of over hyped, over rated hardware.

As for a falcon mac head to head - get two machines of similar spec,
compare the price and then compare the sound-handling capabilities
(this is the Falcon's forum, not Global domination of the DTP market!!

This is the first time i've had to state my views - and that's because
i've been content with what i've got, having seen what I could have, and
haven't felt the need to brainwash others into thinking along the same
monotonous and dull lines that you think. Get a grip, get a life and
wake up to yourself.

Shithead.

: As for System 7.5 taking up 3Mb of memory ... it doesn't, not unless you have
: a bunch of extensions loaded that hog memory. I'd say that most Mac users
: have System configurations which take less than 2.5Mb of memory.

: >> Offering better programming tools (on a Mac??????)
: >> Offering better os documentation (this just gets better....)

: This is an outright lie. Don't try to fool me on this one -- I *have* the
: Atari Developer kit, and it is garbage. Half the documentation is outdated
: material from the original Digital Research version of GEM. They provide
: Alcyon C as a language!

: Contrast this to the widely available Inside Macintosh series, which is
: excellent.

: >> Having more decent games (ever see a Mac run Stardust?)

: You must be kidding ... games, on the Atari?? Are there still companies that
: make games for the Atari?

: >> Having more affordable software (I don't think so....)

: You have to learn to shop around... I paid more than $200 for Calligrapher,
: and I got a slow, buggy program with bad documentation. Is that what
: constitutes "affordable?"

: >> Being a better platform for
: >> learning about computing (you'll learn FA about computers
: >> by using a Mac)

: What is this supposed to mean?

: >> Having a more flexible machine for

3337. PC vs. FALCON

Newsgroup: comp.sys.atari.advocacy
Date: 1994-08-16 16:05:58 UTC
From: gaghon@nevada.edu
Message-ID: <32qo56$6dp@post-office.nevada.edu>
Source record: 16040

Ok, here is some unusal information. Everyone knows that the 486 is comparable to the 040. And that a 486 25mhz CPU should be faster than a 030 16mhz CPU right? Well, I thought so too. The 486 at 25mhz CPU operations should always be faster! Not True. How about a 486 routine that is optimized for the 486 at 25mhz CPU should be Faster! Well, it looks like this is not true as well. Here is two programs, one on a Stock Falcon and one on a 486 25mhz machine. No trick programming, no taking advantage of Falcon hardware. Just plain assembly programming.

Loop counts from 65000 to 0 and gets a word value from address 165000 to 100000 at even and odd addresses. Here are the routines....

486 PC routine

```
mov ds,#6250 ; 6250*16 = 100000 segment register
mov bx,#65000 ; set start of offest to 65000 in index reg.

loop: mov ax,[bx] ; get word value from phyical loc DS*16+BX
dec bx ; Decrement bx reg
jnz loop ; jump if not equal to zero
```

Falcon 030 routine

```
move #165000,a0 ; set phyical location

loop: move.w -(a0),d0 ; dec phyical location and get work value
cmpi.l #100000,a0; compare with 100000
bne.s loop ; jump if not equal to 100000
```

Now, the PC is at an advatage. It uses segment/offset addressing and looping is the fastest when a routine stays within one segment like our example. If that is so, why did it take the 486 .054 seconds to complete this routine and the Falcon .04 seconds to complete it?

Have ran the routines hundreds of times and with different setups, configs, autoexecs, etc.. Results were simmilar. I am not trying to say the the Falcon is faster than a 486. I am just trying to understand that if there is no contest between the 486 CPU and the 030 CPU, then why did the 030 CPU run faster?

Maybe the 030 is not that slow after all?!? :)

It's the other way around, actually. For optimal price/performance, a computer system has to be designed around a *specific* CPU, not just for a CPU least common denominator. On the other hand, there is no problem (and certainly not a performance problem) in attaching a different keyboard to a computer.

Apple probably sells more than 50 different keyboards, not counting 3rd party keyboards, and all have something going for them.

That's 80MHz for the 7100, rather than the current 66, and 100MHz, rather than the current 80MHz for the 8100. What's supposed to be so great, I suppose, is the "fact" that an 80MHz PowerMac runs at the same speed as a 90+MHz Pentium, so the 8100 will be even faster.

All I can say is: Oh yeah.

Like TOS? It's incredible, these Atari apologists. I remember before MultiTOS came out, everyone said that multitasking wasn't necessary, because "STalker and STeno and UIS let me do everything I need without having a multitasking OS."

Yeah, of course there's MultiTOS, which is slow, and doesn't run well on 68000-based machines -- the majority of Ataris out there.

and the PC is a much better bet for

> The Amiga is much better documeted, ROM Kernal manuals and the like. How

That's not what I was saying. I was responding to someone who wrote that
all Atari software was great, and that Atari programmers were always efficient
(can you say FSM/GDOS and VDI?).

If someone claims that Atari software is always great, then it is perfectly
valid to bring up horrible programs like Word Up 3.0, Calligrapher, and
Word Flair in response.

Notice that all the languages you listed use single byte characters and are
all written left to right? System 7 can support double byte (actually it
can support any byte multiple character size) characters and right to left
languages. System 7 also allows you to mix languages of any byte size and
direction in the same document. And I think Peter was wrong; single byte/
left to right languages are free. Anything else will cost you.

> I asked where those wonderful AV macs that you were advocating last year
>had gone... You claimed you were going to buy one, did you????

It must be nice having a nice static platform like the Atari or Amiga.
You can be fairly sure that you will have a top of the line computer for
years to come. The AVs are still good computers. They are no longer the
fastest but the features that made then good are still there. They can still
do video capture. They still have 48KHz sound.

> Oh, and there you go again 'the Video Toaster needs 10 megs..' So What?

Just like high-end word processors, spreadsheats, graphics and DTP software
needs a lot of RAM. On the Mac you can choose between a works program that
takes less than a meg to a super-editor than needs 16 megs.

> And you sound like your usual 'heres a Mac price catalogue' self.

Yeah, I'm a mac advocate and I don't give a crap about mac prices.

This is not an Atari vs. Mac issue -- but don't say that AtariWorks is as good as ClarisWorks. If you can say something like that, you have obviously never used ClarisWorks. ClarisWorks is simply *the* best integrated software available for *ANY* platform. Period. No other Works program holds a candle to it. ClarisWorks is what Wordflair II could have been.

Secondly, please don't quote hundreds of lines of text just to add one line.

For the totally clueless in the audience, the number after the slash refers
to the processor speed, not the hard drive size. It is part of the model
name, not the configuration.

You are actually supporting by compromise argument. The Atari/Amiga is
better because they have good operating systems. The PC has better
industry standard stuff. The Mac has a better operating system than Windows
(which is the standard) yet supports industry standard software like
Excel, Word, Word Perfect, Lotus 1-2-3, etc. OS/2 has no software support
so I would end up running windows programs on it anyway. I would also have to
pay for it since it doesn't come bundled with many machines. Linux is good
if you want to run a UN*X at home. How are the DTP, graphics, spreedsheet,
and word processing programs for Linux?

> USING the platform , day to day. The Mac feels sluggish and takes a
>long time to perform simple tasks. My A1200 performs them quickly and

But how does the A1200 perform when doing complex tasks? Much of the wait
is for the computer to do something. Like a spreadsheet recalc or a
10Mb save. Which is faster doing that?

> The Amiga is much better documeted, ROM Kernal manuals and the like. How
>much documentation has Apple published? I'd bet that most of what is
>available is reverse engineered stuff. Anyone who has been exposed to
>prorgamming will realise that the Mac is just about the WORST choice
>for programming on.

I'm a student and have been out of the development cycle for over a year.
I have the Inside Macintosh series published by Apple. It consists of
6 books that comprise over 3000 pages of documentation. There are five new
books since then I beleive. I also have an incomplete set of technical
notes (also by Apple), they where incomplete then and must be really
incomplete now. They take up 2.6Mb of disk space in TEXT format. I also
own Think Reference (by Symantec) a data base for Macintosh programming.
My version is copyright 1992 and is over 7Mb large. There is also the
Macintosh Revealed series (can't recall author). Every ROM routine on the
Macintosh is documented. None of it had to be reverse engineered. The
mac is hard to program because you have to support so many things to make
an 'acceptable' program. In the first Inside Macintosh book their is

source code for a text editor. The source takes up to pages. Now, if
you added stationary awareness, drap and drop, apple-events, publish and
subscribe, styled text and other System 7 features the code would be
about 10 times larger! This is the price of greater functionality and
you can of coarse use visual interface builders, third-party librarys and
application framewords.

>> Once again I do not understand what you post. My brain is obviosly bad at

>personal machine. Thats the way 95% of non-Mac users feel. If you are
>trying to push your Mac philosophy you are coming to the wrong place.

In what way is the Mac bad at insulating the user from the machine? True
you have to know certain fundamentals like RAM and diskspace but it would
take a VERY abstract operating system to do away with that. Since 75% of
non-Mac users are Windows users your 95% statistic is totally bogus.

By first person I mean Wolf 3-d/Doom style games. Most of those games sound
like overhead view games. I didn't construct a very good good list as far
as flight simulators. Their is a stealth game, a harrier game, a barn storming
game, a red baron game and probably others that I can't think of. That
puts my list as long as yours. Also, how many of those games have been
updated to use 040 hardware? Do they have the high polygon count of
a 'modern' game? I think the mac helicopter game uses texture mapping.

Why does it have to be designed around a specific CPU for optimal price/perf? Almost nothing is designed around a specific CPU anymore - OSes, applications, or general purpose expansion busses (i.e. PCI). One could even take as an example the Runway bus that has been introduced by HP with the 7200 - it wasn't designed for use with a specific CPU either, and it's *part* of the CPU.

For optimal price/perf, a computer system has to be designed around a particular architecture. Which CPU is actually used is immaterial, although in many cases choosing a family of products would make things a whole lot simpler.

This whole concept of a base architecture you can just plug things into was to be the Amiga's future, if Dave Haynie's comments are any indication.

Actually, a computer without a keyboard (or a monitor for that matter)
can be used as a file server much of the time, so selling a configuration
where neither keyboard nor monitor are available is sensible to a degree.
A computer without a CPU is just an Amiga.

GEORGE GAGHON (gaghon@nevada.edu) wrote:

: Ok, here is some unusal information. Everyone knows that the 486 is
: comparable to the 040. And that a 486 25mhz CPU should be faster than a
: 030 16mhz CPU right? Well, I thought so too. The 486 at 25mhz CPU
: operations should always be faster! Not True. How about a 486 routine that
: is optimized for the 486 at 25mhz CPU should be Faster! Well, it looks like
: this is not true as well. Here is two programs, one on a Stock Falcon and
: one on a 486 25mhz machine. No trick programming, no taking advantage of
: Falcon hardware. Just plain assembly programming.

: Loop counts from 65000 to 0 and gets a word value from address 165000 to
: 100000 at even and odd addresses. Here are the routines....

: 486 PC routine

: mov ds,#6250 ; 6250*16 = 100000 segment register
: mov bx,#65000 ; set start of offest to 65000 in index reg.

: loop: mov ax,[bx] ; get word value from phyical loc DS*16+BX
: dec bx ; Decrement bx reg
: jnz loop ; jump if not equal to zero

Here you use a register to decrement to zero for exiting.

: Falcon 030 routine

: move #165000,a0 ; set phyical location

: loop: move.w -(a0),d0 ; dec phyical location and get work value
: cmpi.l #100000,a0; compare with 100000
: bne.s loop ; jump if not equal to 100000

While here you compare the address to another every loop. This is much
less efficiently programmed than the Intel version. Plus, you could use
the dbra instruction (two nested loops do you can deal with more than 64k
at once), to optimize it more.

: Now, the PC is at an advatage. It uses segment/offset addressing and
: looping is the fastest when a routine stays within one segment like our
: example. If that is so, why did it take the 486 .054 seconds to complete
: this routine and the Falcon .04 seconds to complete it?

Gosh, maybe because the 486 sucks rocks? Your intel version is fine,
while your motorola version is poorly programmed, yet the 040 creamed the
486. Makes you wonder, eh? Just think how much MORE efficient you can
program a 680x0 when you take more than 10 seconds to write your code. :)

Now, there is one problem... the 486 CAN move large blocks of memory
faster. The Falcon has a major bottleneck in the cpu-memory bus.

: Have ran the routines hundreds of times and with different setups, configs,
: autoexecs, etc.. Results were simmilar. I am not trying to say the the
: Falcon is faster than a 486. I am just trying to understand that if
: there is no contest between the 486 CPU and the 030 CPU, then why did the
: 030 CPU run faster?

: Maybe the 030 is not that slow after all?!? :)

This is true.

: : and software incompatabilities and needing a lot of set up time. To be quite
: : frank I have my hands full with this constelation of Suns and need plug-in-
: : and-play.

: This is true. Macs are very easy to set up, upgrade, maintain, and
: interconnect.

: I just don't like to USE them.

I you are right--sorta. Actualy, initial setup times are about the same. Both
computers come with just about everything installed in the first place.
Macs are A LITTLE easier to upgrade in that there is a built in SCUSI port
(for a CD-ROM) while only ZEOS and IBM make them standard on PCs. The Mac
networking is so Slooooooooow that you need a real network adapter for any
network bigger than about twenty machines or any network bigger than five
machines if you want anything other than printer sharing and file transfer.
Network adaptors, or any other similar upgrade are just about the same for
both computers. The Mac OS is better at recognizing new devices, as long as
Apple makes them.

I don't like to use Macs either.

Now, I'm no programmer so don't flame me if I make an honest mistake...

As others have said many times in the past on the net - the MC680x0 series has always been somewhat faster and more effiecent that the Intel 80x86 line.

Part of this is due to the design concepts of the architectures - the Intel chips aren't fully optimized as they have to remain backwards compatible with that screwy 1970's 8086 segmented architecture. The Motorola stuff takes a fresh approach and uses a "flat memory" model - no nasty segmentation.

The 030 is plenty fast from what I've heard and seen. The reasons for the Falcon's apparently sluggishness stems from its congested memory-bus and a TOS that is hardly optimized. PCs use graphic cards with their own RAM - this allows their CPUs to perform instructions while still updating RAM, while the Falcon has to handle the screen from its own RAM store - this again slows things down.

We have an extra Wolf 3D (JAGUAR Kick Butt version) hard to find.
Will sell for $55. Or will trade for RAIDEN AND either (Dino
Dudes OR Trevor McFur) Or will trade for RAIDEN + $25
Also have an extra Tempest 2000, same deal as above. Both deals are OBO

We are Jaguar Developers and sometimes get extra product.
Both Tempest 2000 and Wolfenstien 3D are brand new still Shrink
wrapped.

Your Amiga is not out dated? It's pathetic that Amiga 4000 users have to
replace that crappy cpu board with an expensive warp board that costs more than
the Q630.
>
> Why are you posting this crap? No-one cares less about product

There are lots of people who care. You mean no-one? Are you sure. I am
pointing out how redicolous that Amiga and Falcon prices are to Apple's current
offerings. I remember it use to be the other away around how Atari and Amiga
owners would lambast rightfuly so how the mac is expensive. But when the
current offerings of Amiga and Falcons are overprice you get puffy about it.

The current Amiga's are obsolete. It' absurb that Amiga 4000 users have to pay
for C='s development blunders by replacing the cpu board with the expensive
Warp board. 040 Boards for the Mac are 1/3rd the price of Amiga ones. Even
the Mac PowerPC processor upgrade and logic board is way cheaper than that Warp
board that should have been C's design in the first place.

The AV Macs are still being made and sold. However the new AV Q630 will
eventualy take the role with it's low price and AV expandibility. The Q630
will have a PPC processor upgrade as well as the PCI powerMac board as well.

Will the A4000 be upgraded to the AAA when ever that comes out in the next
century?

The problem is Apple does not have a comparable Mac to compare. Apple does not
makes Macs with less than an 040.

As for your sound capabilities are less important. The Q630 is the multimedia
machine that eats Falcon..

Chinese language support is of minimal benefit to anyone outside of
China. The present european language support is whats really important
and the Amiga has it. Personally, I couldn't care less if it didn't
support the other languages either.

>

And just how much software is out there that will exploit the facilities
of the AV macs? Is there a lot of software written for the DSP chip? Apple
launched these machines in a blaze of publicity and in a year or less they
are _totally_ orphaned. Apple claim the future is in the PPC line and they
won't be putting any more developement into the 68k machines, which isn't
exectly great news for anyone who owns a 68k machine that doesn't have a PPC
upgrade slot. Apple are notorious for changing their line up continually.
It doesn't inspire user confidance to know that within a matter of months
Apple may have dropped their machine.

Yes, but one of the main points of your arguement is that you should
get a Mac in oder to run the 'big' packages. If you are going to run the
smaller packages then you are as well getting an Atari or Amiga to do it.
Particularly since you can spend a lot less on your hardware - an A1200
costs a LOT less than a Quadra, no matter how good the 'value for money'
factor is on Quadra machines

No, like AmigaDOS. I remember when all the TOS users slagged off the
Amigas system claiming nobody needed pre-emptive multitasking too. At least
now the Atari has it, the Mac has yet to catch up. The Amiga had it from
day one.

> > It's bad because the Mac simply isnt good enough to perform the job

> You're contradicting yourself. Does the Mac insulate users from how the
> computer works NOT ENOUGH or TOO MUCH? Make up your mind.

Its a stupid mix. It hides too many things, but doesn't do a very
good job of it. Its caught between two extremes. If it was totally
effective, I still wouldnt use it coz' I want a COMPUTER, not some
sort of business appliance. At the same time, since the Mac is trying
so hard not to be a computer, it isn't appealing to home hobbyists. Who
is going to spend 1000 pounds/dollars plus on a machine thats just
going to be used for typing a few letters, holding a small database?
With the Mac, you have to spend big and it doesn't make sense for most
home users. Its a CORPORATE machine, not a home computer. Thats why
the majority of people here have such a low opinion of it.

> > What I, and most Atari and Amiga owners want, is a REAL

Quite probably ;-). Certainly its no more stable than the much maligned
AmigaDOS. And its a lot less 'smooth' to use.

Yes, I can see it now...

'Here is our next Generation of computers. They are the future, buy
one now or be left behind......`

within 3 or 4 months....

`Buy our new, Improved PowerMac. Much faster than our old one
and cheaper too. 9 out of 10 owners said they prefered our new
PowerMac to our old one.....'

A couple of months is a very short time to outdate a machine.

Apple Macintosh - The Soap Powder Computer.

: as they soon find their old 386's or whatever can't cope.

: Of course, technology marches on but I'd like to see new hardware
: being put to use running more powerful, functional programs instead of
: helping the software companies make more money.

: Gavan

They may have to pay more for their hardware but this is an initial cost you
have to weigh this up with the ability to do what you want today rather
they having to wait for another year so the machine code programmers can
complete there code. By using an object oriented approach of code reuse
you may not get the best performance out of a piece of software but that
software will be with you today saving time and money. Hopefully as more
of the SW goes this way less buggy software will be released in future as
the underlying objects become more stable. Most bugs probably occur due
to the programmer trying to optomize the program.

Paul Brown.

>030 CPU run faster?

The 16MHz 030 should be comparable to a 386DX 25+MHz. If you're using 486SX, it's possible that the difference lies there (I've heard that 386DXes can perform some functions faster than a 486DX). The possibility: the 680x0 series of chips has fewer memory boundaries than the 80x86 line, as well as a larger internal memory. It's possible that since you were simply accessing memory, the more efficient 68030 was able to outperform the 486. I would guess that if you did several different types of routines, the 486 would average out to be faster than the 030.

>Maybe the 030 is not that slow after all?!? :)

The 030 is deffinitely not a slow chip; if it were, the Falcon wouldn't be able to do the things it does (direct-to-disk recording, etc.).

No, just polite, Peter. If I posted new PC models and prices to the
mac.advocacy group, and then said how much Macs suck, and how great PCs
are, people would get upset. This is precisely the kind of thing you do;
it's a very immature thing, like saying "nah, nah. Mine's better than
yours is." Most people stop doing this, and take a more mature, less
offensive approach sometime around junior high. Perhaps you could try a
slightly different approach?

>
>If you got your head out of your ass, there will be logic board upgrades.
>What you are saying is that because there will never be a Falcon II, the Falcon
>will remain current and never be obsolete?

Logic board upgrades? For which machines, Peter? I suppose the entire Mac
family of the past year and a half will be completely upgradable to both
PowerPC and PCI? Hardly. Only the 040 Macs will be directly upgradable to
PowerPC; the 030 owners will have to settle for an accelerater card. All
those poor saps buying LC 550's right now are going to find their machines
hopelessly outdated within a couple years, and no good way to upgrade,
short of taking a huge loss on their system and buying a new one. And PCI?
If you own NuBus on an 040 Mac, your best bet is to just wait a year and
buy a new machine. It's not likely you'll have the space in an 040 Mac to
upgrade both, even if anyone figures out how to add PCI to an older
machine.

And as for that rediculous "Falcon II" bussiness, you managed to
demonstrate nicely just how poorly you understood my post. Macs belong, by
and large, to families and educators. People who can't afford to buy a new
machine every couple of years. With their market in mind, do you really
think that it's smart for Apple to make some major revision to their
products every year? Apple should continue to improve the Macs, but when
they introduced PowerMac, they should have also introduced PCI; that way
people would still have a current machine a couple years down the line,
rather than being obsolete almost as soon as they bought it.

If you don't agree, Peter, think on this: the PC market is so successfull
precisely because it has maintained a great deal of backward compatibility.
Someone who bought a PC a several years ago needs to upgrade not because of
basic changes in the architecture, but because newer programs require more
speed and memory. Most programs that home uers buy don't require new
systems anywhere near as often as Apple's architecture changes, so a person
can be comfortable buying a new computer once every five or six years,
rather than once every two.

While I like seeing new systems and new capabilities as much as anyone (and more than most), Apple just doesn't seem to be thinking very hard when they make a major revision to their product line twice in as many years, rather than making both revisions at the same time.

What I would need to know is what 486 you are using (SX or DX) and the state of the instruction and data caches in the 68030.

If you are using an SX then there is no internal cache available, so the 68030 should have both its' caches turned off, for a valid comparison of system bus performance. If it is an SX and the 68030 caches were disabled, the result you achieved is predictable simply from the memory access timings of the two cpus, and I am assuming that the Falcon processor is using one async bus cycle per instruction, and one async bus access per read.

If you were using a DX then something sounds fishy.

But what you have found is that in the PC market not everything is what you would expect it to be. There are extreme differences in system throughput from one machine to the next, even if they use identical processors, and caches, simply because of the motherboards design.

In the PC market it really is "CAVEAT EMPTOR"

Brian

???????? The 486SX _does_ have the same internal cache as the 486DX.
The difference is that it doesnt have the FPU that the DX has. Everything
else is the same.

Thanks for the compliments, Ari; you're quite right that things are less
than ideal (to put it very mildly) in the Atari market. In fact, the
market has been declining steadily for years, and Atari's abandonment of
their computer line obviously does nothing to help. It's been very sad
to see Atari's arrogance, bungling, and flagrant mismanagement reduce
their computers from Macintosh competitors to also-rans in just a few
short years.

But life does go on...

There are many apps for the dsp. As for not put anymore development in the 68kmachines shows me how iraational you are. Does the Q630, PB500 and Duo280 series ring a bell. The development work on the Q630 began last August of '93'. Less than a year from drawing board to manufacturing..

As for the PPC, in the next two years all Macs will be
PPC. Older macs like the II series will have a Digital DayStar PPC upgrade. These solutions are available today.

Gavan, will the A4000, A500, A600,A1200, A2000, A1000 have an AAA upgrade?

I think not?What about those millions of Amiga 500 users who could not upgrade their machines to AGA

Thats funny, the local WalMart and Best Buy have Performa 550 with Power PC
ready stickers on the box. I suspect Apple will provide a logic board upgrade
to the P500 series because of the ease of the upgrade. All you have to do is
open the back panel and the mother board will slide out. like a cookie sheet.

Thats the cost of progress. The Mac II series can get a 80 mhz PPC601 Digital
DayStar upgrade card that fits in the Nubus slot.

On any platform, computers depreciate in value once you take one home. What is
your point? 486 users have to sell their machines to buy a Pentimim one. At
least Apple gives you an option.

>

>

You don't know what people can afford. As for major revision thats not true.
People who bought Macs two years ago can run todays software.

As for PowerMacs, they are far from obsolete. even with the PCI macs comming
next May. PCI was not ready for the market and users wanted speed today with a
proven archeticture. Apple made the right decision. As for PCI, that will be
ready in May of 95. Powermacs will be current for many years as are the QUADRA
ones.

> If you don't agree, Peter, think on this: the PC market is so successfull

> rather than once every two.
>
Thats not true. People need at least a 486 to run current software and a
Pentimum to run Chicago.

As for archeticture? The archeticture on the Mac is the same..

> While I like seeing new systems and new capabilities as much as anyone (and
> more than most), Apple just doesn't seem to be thinking very hard when they

> than making both revisions at the same time.
>
Apple does not make major revisions as in new archetictures. What do you mean
by that? Apple is forth comming with new machines because they found a way to
make them cheaper than the previous one. Compaq, IBM and Dell have major
product changes as much as Apple does.

Quite frankly, any machine you buy today will be hopelessy outdated (in
comparison to the newest hardware) within a couple of years. They will
still be usable (just like my trusty 1040), just not state of the art.
The Falcon will not be obsolete in two years because it will still be
at the top of the atari line.

3382. Legality of emulating TOS

Newsgroup: comp.sys.atari.advocacy
Date: 1994-08-17 21:28:04 UTC
From: ddoucett@nyx.cs.du.edu
Message-ID: <32tvd4$1vm@nyx.cs.du.edu>
Source record: 16082

I have seen a few people talking about how it would be nice to have an ST emulator for other systems (MAC/PC,etc). What I am curious about is whether there is a problem emulating TOS ROM chips in software for such emulation. Does anyone know if atari would allow this, or what a programmer
would have to go through to get permission if they did allow it?
Thanks..

This is not true! The two routines can not be compared!

>486 PC routine
>
> mov ds,#6250 ; 6250*16 = 100000 segment register
> mov bx,#65000 ; set start of offest to 65000 in index reg.
>
>loop: mov ax,[bx] ; get word value from phyical loc DS*16+BX
> dec bx ; Decrement bx reg
> jnz loop ; jump if not equal to zero

I've never programmed an Intel processor (and I never will), but the code
looks OK.

>Falcon 030 routine
>
> move #165000,a0 ; set phyical location
>
>loop: move.w -(a0),d0 ; dec phyical location and get work value
> cmpi.l #100000,a0; compare with 100000
> bne.s loop ; jump if not equal to 100000

This code, however, does not do what it was intended to.
The predecrement mode for a word access decreases the address register by
two, causing the loop to read 32499 words at even addresses.

>Now, the PC is at an advatage. It uses segment/offset addressing and
>looping is the fastest when a routine stays within one segment like our
>example. If that is so, why did it take the 486 .054 seconds to complete
>this routine and the Falcon .04 seconds to complete it?

Looks pretty obvious to me:

- The 486 code is doing twice as many reads.
- Reads on odd addresses are (very likely) slower. Possibly twice as slow.

Try running the two routines again with the following changes:
486 '030

```
... ...
dec bx move.w (a0),d0
dec bx subq.l #1,a0
... ...
```
That should give you something to compare with.
You'll find that the 486 is quite a bit faster....

>Maybe the 030 is not that slow after all?!? :)

The '030 is a nice chip, though far from the '040/486. It's the 16 bit
processor bus and the memory contention that slows down the Falcon.

A few things that has been mentioned in other parts of this thread:
- The '030 is not much involved in the direct to disk recording on the Falcon.
There is DMA from the CODEC to the memory, and from memory to disk.
- The only difference between a 486SX and a 486DX is the FPU.
- The initial states of the '030 caches are irrelevant due to their size.
- The initial state of the 486 cache is nearly irrelevant, due to size again.

(I hope the .signature gets added below. Last time I got two of them.)

David,
What was the last version of TOS that you used? Methinks that
you haven't used 4.04 (correct me if I'm wrong). If I am right
than I must admit that I am quite annoyed that your comparing
System 7 to an older version of TOS. I could, for example, compare
System 6.x to the newest TOS and laugh about how TOS wins hands
down.
Also, what is wrong with having Auto folder patches?! Does it
exhaust a user to copy a program into Auto and then forget about
it? Would it be better to wait for a system upgrade?

Ben,
What do you mean "if you want to make it worth a damn?" I have SpeedoGDOS installed along with a few other programs on my Falcon and still have over 3 megs of RAM left. And Speedo GDOS works quite well. The output to my Canon BJ-5 is great.

I'm not sure what you mean. What is it that the Atari and Amiga have that
the Mac doesn't that makes you consider them a "real computer" and the Mac not?
You have reiterated your position, but have not explained it! Honestly, I
don't know what you mean.

Charles,

That "Decline of the Atari Empire" is the reason that I'm writing this post on a PC clone right now... Anyway, beleive me, I do know how hard it is to make an honest buck in the Atari market. I've worked on Shareware and a few commercial games (as a gfx man) and it has not been worth my while!

Good luck with your endeavors and I hope to see you guys on the PC side of things...

Ari

According to the Apple reps I've talked to, Daystar will be handling the
upgrades to PowerPC from 030 Macs, and the only expansion which will be
available will be in the form of an accelerater card, which means slightly
limited speed and compatibility. When asked specifically about the LC 475
and 550, their response was "accelerater cards."

>Thats the cost of progress. The Mac II series can get a 80 mhz PPC601 Digital
>DayStar upgrade card that fits in the Nubus slot.

Accelerater card, you mean.

>On any platform, computers depreciate in value once you take one home. What is
>your point? 486 users have to sell their machines to buy a Pentimim one. At
>least Apple gives you an option.

You're full of shit, Peter. Most 486SX and DX systems are directly
upgradable to Pentium; just switch processors and go. Don't comment on
subjects you obviously know nothing about.

>> And as for that rediculous "Falcon II" bussiness, you managed to
>> demonstrate nicely just how poorly you understood my post. Macs belong, by

>
>You don't know what people can afford. As for major revision thats not true.
>People who bought Macs two years ago can run todays software.

Peter, I sell the damn things, and I have a very good idea of what people
who buy Macs can afford. My statement is absolutely true. There are the

exceptions, but by and large most people who buy low- or even mid-level
Macs don't have the resources to replace them every couple of years.

>As for PowerMacs, they are far from obsolete. even with the PCI macs comming
>next May. PCI was not ready for the market and users wanted speed today with a
>proven archeticture. Apple made the right decision. As for PCI, that will be
>ready in May of 95. Powermacs will be current for many years as are the QUADRA
>ones.

It depends on your definition of "current." Nubus is on the way out, and
within a couple years I dubt you'll find many new ones made. People who
buy NuBus equiped Macs now, with the intent of using them within a year or
two, will find that they have to upgrade to a computer that has PCI. As I
pointed out, buying a new system this often just isn't feasible for many
Macintosh (or PC, for that matter) owners.

>> If you don't agree, Peter, think on this: the PC market is so successfull
>> precisely because it has maintained a great deal of backward
>> compatibility.
>Thats not true. People need at least a 486 to run current software and a
>Pentimum to run Chicago.

No; the software will run on any 80x86, just not at optimum speed on the
slower chips. And the hardware has hardly changed; you can use the same
expansion cards in a 286 as in a 486.

>As for archeticture? The archeticture on the Mac is the same..

The same as what?! The same as when the Mac 128K came out? Hardly.

>> While I like seeing new systems and new capabilities as much as anyone (and
>> more than most), Apple just doesn't seem to be thinking very hard when they
>> make a major revision to their product line twice in as many years, rather

>product changes as much as Apple does.

They change names once or twice a year, not 3 or 4 times like Apple, and
none of them change basic system architecture (i.e. 680x0 -> PowerPC, then
NuBus -> PCI, etc.) as often as Apple. Pay more attention to the market,
Petey.

pischke@ecf.toronto.edu (PISCHKE DAVID) reciprocates:
>The lack of a keyboard allows the buyer to choose a keyboard that suits
>his/her needs and/or finances. The lack of a CPU is just plain stupid.

Of course, we could resort to another car analogy. [Groans heard from
news sites all around the world.] I would equate a CPU with an engine
and a keyboard with a steering wheel.
Hence, a car could come without an engine: choose your own to suit
your needs and/or finances.
Similarly, it could come without a steering wheel: choose your own to
suit your needs and/or finances.
Obviously, a car without a steering wheel is equally as useless as a
car with no engine: that is not the point. The point is, which is the
part that you want to choose? There is no "right" answer - the choice
is entirely subjective. What you choose does say something about your
attitude towards the machine, however. Elaborating on the difference
in attitude is left as an excercise for the reader.

Its hard to explain. It's a 'feel', a way of working. The Amiga has it,
the Atari has it, the PC has it a bit but the Mac not at all..... Maybe its
just the mindset of users but just about every Amiga user I know who's used
Macs hates them .. We find them too slow and cumbersome. Many people who`ve
never used computers before use a Mac first and like its way of doing things
but the majority of people who have learned how to use other systems find
the Mac too geared towards making things easy for beginners meaning it
doesn't offer the possibilities of Amigas or Ataris for technical use.

They certainly are (for the Amiga anyway). Psygnosis bought the
rights and republished them in a single pack. Despite their age and
relative crudeness of gfx and sound, they are still two of the best
dungeon games ever. Dungeon Master 2 - Skullkeep is just about to be
released for PC and Amiga.

ha ha ha - A Quadra 630 is an 'entry level' machine... Thats the whole point, when you buy Apple you have to spend big on a really powerful machine to get any sort of performance. The 630s may offer a good price for the specs, but very few people have that sort of money to spend on a home machine. Thats why the Apple is so unsuitable for home users. Yet, as a business machine its outgunned and outnumberd by the PC.

Home or office, the Apple is second (or third) best.

> blah, blah, blah. All unfounded crap.

Not at all. Apple is more and more the corporate giant. It's just like a mini IBM. They used to sell Macs on the basis that they were the machines for the individual, but now they are just corporate boxes sitting on the desks of businesses. They still use the 'you're too stupid to use a real computer' line to sell Macs though - and judging from certain Mac advocate posts here this may well be true.

> >computer" theme that Apple has been playing on for so long has done a lot

Not only have they screwed up the idea of computers having a CLI
but thanks to their legal department they've managed to make it
difficult for anyone else to create a good GUI.

> >anyhow, the performa is a shit machine, I'd rather have the 1200. The only

>: looping is the fastest when a routine stays within one segment like our
>: example. If that is so, why did it take the 486 .054 seconds to complete
>: this routine and the Falcon .04 seconds to complete it?

Because the two loops are not equivalent!

The predecrement on 'move.w -(a0),d0' subtracts *two* from a0 because a
word operand is being loaded into d0. The x86 version is subtracting *one*
from bx each loop, and so is doing twice as much work. I've never programmed
a 68030, but on a 68000 loading up a word from an odd address will also cause
an address error...

And to be totally fair, the 68030 code is predecrementing so you should load
a0 with 165002.

> Why does it have to be designed around a specific CPU for optimal price/perf?

Take as an (admittedly contrived) example a system that would work with:

- A 25MHz 68040
- A 100Mhz HP PA-RISC
- A 200Mhz Alpha

A board designed for these purposes would need a big, fast, and specialized L2 cache for the PA-RISC (which has no on chip caches), and it would need a high robustness against RF interference from the Alpha. Both of these would add much more cost than could be justified for any of the other processors.

> For optimal price/perf, a computer system has to be designed around a
> particular architecture. Which CPU is actually used is immaterial, although
> in many cases choosing a family of products would make things a whole lot
> simpler.

It is true that having a signle board for several CPUs of the same family might well work, but it would probably still be wasteful to use a 100MHz Pentium board for a 25MHz 486 board.

> This whole concept of a base architecture you can just plug things into was
> to be the Amiga's future, if Dave Haynie's comments are any indication.

There are lots of things that should't change for different processors (and your comments regarding PCI and such were well taken), but the main board is not IMHO among them.

From: gaghon@nevada.edu
Message-ID: <32vv8t$h52@post-office.nevada.edu>
Source record: 15958

OK, now this sounds right! I optimized the 030 code and removed the CMP & BNE and replaced it with a DBF. I doubled the amount of reads on the 030 so it moved 65000 words like the PC. The time is .053 instead of .04 like before. I ran the test 1000s of times and then divided the timer's result by 1000 to get this result.

On the PC I also ran the test 1000 times and divided the timer. Seems like I forgot that the timer on the PC has a resolution of 1/18th of a second or .054 sec. So, now my PC reads .028, about twice the speed of a 16mhz 030. Thanks for the help....

What a Video Game developer thinks of the Jagflop and Atari...
==========

Peter---
Sorry, you haven't met me, but I have been following your input on the Jaguar Newsgroup and I must praise your sense of understanding of the industry... Keep up the good work. You seem to have a very good grasp of the gaming industry. Just thought you would like to know that your not alone in your opinions.

I am the President of (name withheld) (you might have seen our ads in GameFan and GamePlayers). We have always hated the Jaguar for the lack of forethought and experience of Atari. We feel that the Jag is nothing more than a strict Money grabbing scheme of which Atari knows full well that it is. I know the Tramiels and know most of their staff.

It is a con. We feel the 3DO is a nice "computer platform" but cannot

compete as a game system when the big boys bring their guns to bear. We are not against new systems, but we are against the stupidity of the Jaguar.

Atari has not done ANYTHING that they had promised in the way of marketing and release dates. 3DO on the other hand has at least kept their word and are seriously trying to bring out a quality system, although you and I know what is in store for them. You have to give 3DO some credit by not turning their backs on their customers the way Atari has. These guys are some dumb that they don't even know their being takin.

Believe me.... The big boys in the suits have even told me that Atari is on the take......

Keep the faith brother....

(Name deleted)

Second response:

To answer some of your questions:

To be "on the Take". Meaning that they know full well that they cannot compete against the new super systems and that by showing a half-assed ad campain, they can recoup their initial costs. After the initial costs are covered, they then make a quick profit and then can the system. This is what happened with the Lynx.

The Lynx was a better system by far, not including the Turbo Express. What the Tramiels did was push the hell out of the Lynx and give away the development systems to whomever. These developers then devoted many man hours to come up with games. This in turn, allowed them to sell alot of Lynx's TO HIGH LEVEL BUYERS. (i.e. K-Mart National buyers, Toys-R-Us, etc) after they made a ton of money in these sales, Tramiels then "cancelled" the system. Now, everyone knows that the system is dead and the retailers can't move a discountinued system. Game developers can't sell games for a dead systems and the end users got stuck. Meanwhile Atari saves millions on ad campains. Now, they are doing the same thing with the Jaguar and nobody trusts them. I wouldn't either!

What kills me is these guys that sort of watch the industry and have all this "insite" of the industry. We see the thing "run" at the CES and looks and plays like crap. We have actually seen the stupid thing go and everyone wants to get militant about something they only get as hear say. And they know it all!

Dumb.

See ya!

Well, it's not all that contrived. Except for the Alpha, and you've got what an AAA Amiga was to be.

>A board designed for these purposes would need a big, fast, and specialized L2

A *motherboard*, yes. A separate processor card, no.

That's it, though. The main board need not change. Define a standard interface
to a CPU card, and build the rest of the computer system around it.

Of course, skimp on the design, and you'll get an A4000, but there's no reason
why you couldn't support 040/060 and PA7100/7200 well.

Too cowardly, or embarrassed of the grammatical/spelling errors in
the "letter." :)

Seriously though folks. A lot of the noise of recent weeks seems to have
died down a bit. Why not just ignore this clown. He obviously has an axe
to grind w/ Atari for some reason or another, and there's no point in
debating with him. Maybe if we ignore him he'll get bored and go away.
(I'd not have even read this thread, but I've lost my access to NN. Grumble

Anyone else notice that this unnamed company president makes many of the same grammatical errors in his letter as our friend Sinclap does every time he opens his mouth? Lame, very lame. Though Pete's English is getting better, I'll bet it still took him a whole afternoon to write that letter from his anonymous source. The stupidity of his attempt alone ranks him at about 4th grade on the education scale. Anyone have another guess? :) Maybe we could make it a pool, everyone anties up a Jag game and whoever is closest wins 'em all. I'll take 4th grade and toss in Crescent Galaxy!! ;)

It strikes me as amazing how the writer of these letters incorrectly spelled words in much the same way as "sinclap" does in his posts, uses the same punctuation style, and has the same types of grammatical errors.

Coincidence?

To the anonymous president:

Please email me.

I will treat your name, and company name, and game titles
as restricted information.

What I will do is verify that you:
1) Are the president of whatever company you claim to be.
2) That you are actually advertising and shipping games.

I will post to this group the results of my findings. Basically I
will post that you do/do not exist and are/are not shipping games.

Basically we do not believe anything originating from Peter's account.

Thank you
Brian

p.s.
Your credibility, and Peters, would be greatly enhanced if you
posted your critisism(sp?) of Atari to either:
rec.games.video.atari
or
comp.sys.atari.advocacy.

fascinating... do you experience blackouts and memory loss when these alternate personalities take over, peter, or are you concious of thier actions? i'm assuming you must be fairly unknowldegable of news protocols and systems, or we would have heard from some of these personalties before in the form of forged posts.

if you will notice, i dont post here regularly, just a casual reader, of here and r.g.v.3do, but after seeing the... posts, of Mr Sinclair well, it interested me. i mean, his posts do show *some* glimmering of intellect at times, not the 'shut-up f**k head!!' that appear all to often in almost any group (heh, you were guilty of this a while ago Tal), but he seems oblivious of his fixation.

sinclair, are you doing this for fun? or do you actually believe what you post?

- jeremy

ps - hate to say it guys, but the 3do group is a level more informative than here, though you do have better HW threads often.

Okay -- let's look at a few things here.
1. I paid good money for my Lynx development system. I had to save and
wait a long time to get one. No-one ever offered me a deal and I think
I qualify as a "whomever". And it's not like I waited til now either as
I started supporting the Lynx as soon as I read on the net that Sears was
selling them the year they first came out.

2. My SO works at K-Mart headquarters in Troy MI and can easily verify
whether K-Mart ever sold the Lynx which to my understanding, they didn't.

: >clear advantage of allowing you to not boot with it if you don't need it
: >and need the RAM for something else. Here, we have two places where
: >Atari memory management is clearly superior.

: RamDoubler corrects a memory flaw while SpeedoGDOS corrects a speed flaw.

WHAT? What speed flaw? Do you have any CLUE about what SpeedoGDOS is?
It referrs to the type of font it uses: Bitstream Speedo fonts.
SpeedoGDOS doesn't correct any flaws. It's bart of the Operating System.

: >Anything unix-based is almost absurd. On the other hand, it's a real OS
: >with good memory management and other such niceties, plus it's built for
: >huge networks and interfacing with the Internet. The Mac's OS is huge
: >without these features. Very bad.

: The NeXTStep is better than System 7. I use a NeXTCube a school and the OS
: is better than System 7 in almost everyway. But System 7 has features
: similar to those of NeXTStep that make it better (feature wise) than
: OS' that fit into 200K.

Some of the space that System 7 requires is useful. Most of it is wasted
space.

: >Just as bad. Plus, the whole OS was written in Pascal, a language that
: >doesn't lend itself to efficient object code. The design of the language
: >sacrifices efficiency (in both size and speed) for structured design.
: >I'm sure the Mac OS could (in theory) be easier to maintain than one
: >written in C, but it's a tradeoff I'm not willing to make, plus, as bad
: >as the OS obviously is, the programmers don't even know how to program
: >Pascal well.

: Actually, Pascal leads to better efficiency than C as far as object code

This is crap. C is designed to make it easier to produce efficient
object code. Pascal was designed by someone who wanted to teach
programming, so he made a programming language that favored structure

over efficiency.

Didn't you ever learn about this basic stuff in school?

: goes. A pascal compiler does not have to worry about functions that
: can accept an indeterminant number of parameters.

Actually, it's worse, because it has to worry about functions that don't have a pre-determined arrangement of parameters. For example, write, writeln, read, readln... and any other such function.

: Pascal doesn't have to
: worry about complex statements in for loops.

In C, it's specified explicity. In Pascal, it's specified implicitly and you have less control. The same stuff is done; same net effect.

: Pascal also has a 'goto'
: capability that makes writting unstructured code possible.

C had a goto. If you don't know that, you shouldn't be comparing the languages.

: C is actually
: more structured than Pascal.

Pascal is more type-restrictive than Pascal and the syntax is more strict. It's a TEACHING language, not a programming language. It's DESIGNED to be more structured than C.

: The finder actually ballooned when it was
: re-written in C++ and performed more slowly.

You REALLY don't know what you're talking about. C and C++ are NOT the same. I'm comparing C to Pascal and you throw in C++. Nice try, but it's not going to work. Any idiot knows an object oriented compiler can't predict ahead of time which inherited objects are going to be used and which aren't. When one class is based on another, it has to take the entire inherited class, whether it's used or not.

: The MacOS was originally written
: in Pascal but most has been rewritten in C.

I doubt it. Apple doesn't care that much about efficiency to want to even improve OLD code written in Pascal, let alone rewrite it in C.

: Yes the OS is obviously bad
: (pause as I throw my computer through a window) now I can run windows and
: gain a huge speed increase!

Windows isn't something to compare against. It's even worse. The 680x0 is a great processor, but the Mac hardware and OS ruins it. The 80x86 is a horrible processor and Windows makes it even worse.

Considering how much faster Motorolas are than Intels and how much faster
Windows is than System 7 (very often), System is obviously a very bad OS.

And, in light of your above comments about programming languages, you're
obviously not qualified to argue this topic.

: >I've glanced at a few things. The price tags usually is what turns me
: >off first.

: I have an ST and a mac. Falcon for the ST cost me more than Hornet for the
: mac and Hornet is far better than Falcon. Which platform is screwing me?

So, you pick out ONE piece of software where you get a better price. Big
deal. I'm sure Atari users could give you reams of prices that are
better for Atari's.

: >Both. The problem with Mac software is that the attitude behind the
: >computer is to have the computer do all the thinking for you, and this
: >annoys the crap out of me.

: The computer should do as much thinking for me as it can. I'd rather not
: work at all and just have my computer do my job for me.

My Atari doesn't get in the way of what I want to do, while the Apple
does. I get work done faster on an Atari than I can on a Mac. Sounds
like the Atari's GUI is better designed.

: >Most of the people who have used something decent like an Atari are
: >frustrated when they have to use a Mac.

: I had an atari. Now I have a mac. I like it.

I'm not debating that. You can like a Mac all you want. Just don't go
telling how stupid my Atari is and how I should get a Mac. You shouldn't
even be in this newsgroup.

: >Mac is no good for video processing. The OS gets in the way of any
: >processing that requires a lot of system time, and the I/O hardware slows
: >down the CPU.

: OK, lets do a test. I'll digitize some a video sequence and compress the
: data using Cinepak. You can do the same and we'll see which is faster using
: stock computer components and software.

I'm surprised that you CAN digitize video. How much did the extra
equipment cost you?

: >I have never seen a quicktime player that played faster than 15fps. And
: >I have never seen a quicktime player that played with a constant frame rate.

: Sorry.

Sorry is right. Sorry piece of crap Mac.

: >and need the RAM for something else. Here, we have two places where
: >Atari memory management is clearly superior.

: Is SpeedoGDOS a memory hog like FSM/GDOS was? (Serious question here.)

I don't think so. I really don't know. I made my caches too big and didn't bother with it and still didn't notice a memory problem. All I can say is that I've never had a problem with it.

Oh, and don't use Atari works to compare SpeedoGDOS to something else. Works is crap and doesn't use GDOS right. It can't even work efficiently when using a bitmapped font or the system font and a graphics accelerator. I compared by writing my own program, and after the cache fills up, SpeedoGDOS is FAST!

: >Just as bad. Plus, the whole OS was written in Pascal, a language that
: >doesn't lend itself to efficient object code. The design of the language

: >written in C, but it's a tradeoff I'm not willing to make, plus, as bad
: >as the OS obviously is, the programmers don't even know how to program
: >Pascal well.

: Not true. Apple doesn't use Pascal any more, and now recommends to its
: developers that they use C/C++.

This may be true, but it's too little, too late. The bindings still have to deal with Pascal strings and Pascal parameter passing conventions.

: >: If you spend $500 on crappy software then you are a moron no matter what
: >: platform you use.
: >
: >This is true, but for the Mac, you're restricted to bad software.

: You have obviously never used any Mac software.

I've used enough to know I'm not impressed.

: >: What's real computing. Is it using spreadsheets and using word processing
: >: which is most of what computers do? Or is it about configuring software
: >: and learning file systems?
: >
: >Both. The problem with Mac software is that the attitude behind the
: >computer is to have the computer do all the thinking for you, and this
: >annoys the crap out of me.

: Really? How is the premise behind the Mac interface that "the computer does
: all the thinking for you?" I've never understood this statement. Please
: elaborate, and provide some examples.

It's kindof an intangible thing, really. The machine FEELS like it's
slow, and it FEELS like it's making things more difficult. It's just the
attitude of the UI design. Things feel like they take more effort, and
the feel like the machine is trying to do things for you that you don't
necessarily want done. It kinds gives me the willies and some times
makes me sick.... It's kinda like being forced to eat brussel sprouts,
except there aren't even any vitamins you're eating it for.

: >Most of the people who have used something decent like an Atari are
: >frustrated when they have to use a Mac.

: I was an Atari owner for 9 years before I abandoned it to get a Mac.

Atari's are good machines. The manufacturer, on the other hand, can't
support the machine. For this reason, I don't blame many people for
switching machines.

: >Mac is no good for video processing. The OS gets in the way of any
: >processing that requires a lot of system time, and the I/O hardware slows
: >down the CPU.

: Yeah, sure buddy. I guess you've never seen the flying Pentium commerical,
: or any of the other productions that have used Macs for video processing.

And I'm quite sure that they had to record it frame by frame, using a VCR
that the computer could tell to record one frame at a time. Any computer
can do this, even if it took minutes for each frame.

For Sale:

Master Tracks Pro 3.6, powerful sequencing software for Atari ST computer. 1 Meg required, works with TOS 1.0, 1.2, 1.4, 1.6. Also have Band In A Box self-generating music software for the Atari ST computer. Neither program is copy-protected, so easy installation on your hard disk. Original disks and manuals. Both programs for $100. Saving up for Cubase Audio Falcon. Leave E-mail for atariman@aol.com if interested.

Wolfgang Zweygart (wz@echo.chem.TU-Berlin.DE) wrote:

: I hope Aplle will compete with his PPC models against the Intel crap.

Until people can get what they WANT and not what some company dictates
to them Intel machines will be around. I hate Windows, DOS, OS/2, MacOS,
NT, etc. All commercial crap where I have no say and I'm completely
at their mercy. With a Mac I'm forced to use MacOS. With an Intel
machine I can choose from dozens of free, shareware, and commercial
operating systems.

Apple's move to PCI is a good one. At least then Apple owners can
start getting good hardware upgrades at computer shows and mass
market dealers. That's something Apple users have been missing out
on for a long time.

Finally, Intel is not going to just sit still and watch the world go
by. Granted, backward-compatibility was a mistake for Pentium but
that chip is more complex than most other companies could produce
and that kind of expertise is capable of turning out a PowerPC
killer. Intel makes a lot more than just micro CPU's too. They have
parallel machines, minis, etc.

Of course, that's good because competition is great. That's one reason
I love UNIX because no matter what hardware wins, I'll have UNIX to
run on it. It's on EVERYTHING.

: The rapid change of models and features is good for the marketing and bad
: for the buyer...

More reason for an OS that is NOT from Apple and a good argument for
PCI bus. Keeps you from depending on Apple and being hurt too much
by their rapid changes.

GEORGE GAGHON (gaghon@nevada.edu) wrote:

: Ok, here is some unusal information.

It's also incorrect.

[blab blab blab deleted]
: one on a 486 25mhz machine. No trick programming, no taking advantage of
: Falcon hardware. Just plain assembly programming.

And a total lack of reasonable testing.

: Loop counts from 65000 to 0 and gets a word value from address 165000 to
: 100000 at even and odd addresses. Here are the routines....

How incredibly useful. Too bad it's not doing anything real.

: 486 PC routine

: mov ds,#6250 ; 6250*16 = 100000 segment register
: mov bx,#65000 ; set start of offest to 65000 in index reg.

: loop: mov ax,[bx] ; get word value from phyical loc DS*16+BX
: dec bx ; Decrement bx reg
: jnz loop ; jump if not equal to zero

: Falcon 030 routine

: move #165000,a0 ; set phyical location

: loop: move.w -(a0),d0 ; dec phyical location and get work value
: cmpi.l #100000,a0; compare with 100000
: bne.s loop ; jump if not equal to 100000

: Now, the PC is at an advatage. It uses segment/offset addressing and
: looping is the fastest when a routine stays within one segment like our
: example.

Also not true. The 486 doesn't use segment/offset in native mode. It
uses linear addressing with a selector to pick 4gb address spaces. I
have run code in real mode (8086) and then in native (protected) mode
and the protect mode program was several times faster.

: If that is so, why did it take the 486 .054 seconds to complete
: this routine and the Falcon .04 seconds to complete it?

Who cares? You are bragging about .014 seconds which could easily
be caused by your running in real mode and not the 486's native mode?
By a bad cache, by bad BIOS settings, etc? Bah! Humbug!

[stuff about autoexecs and config.sys's deleted]

Well right there is your problem. You take a 486 which has an address
space measured in terrabytes, can do multiple 32-bit memory fetches,
etc. and you run a 16-bit OS on it with a 20-bit address space limit.
How could you possibly expect performance out of that?

: were simmilar. I am not trying to say the the
: Falcon is faster than a 486.

Good. Especially given 486's that run at 40mHz, 66mHz, 80mHz, 100mHz,
and faster.

: I am just trying to understand that if
: there is no contest between the 486 CPU and the 030 CPU, then why did the
: 030 CPU run faster?

Number one, your test is meaningless. You'd be hard pressed to find
programs that only used mov's and a loop.

: Maybe the 030 is not that slow after all?!? :)

Of course it isn't. Motorolla 680X0's are very good at fast register
manipulations and have lot's of them. Intel machines have only 12
generally available registers and only four of them are general purpose.
The rest are for hardware multitasking support (basically making the
386/486 the equivalent of an IBM mainframe) and you only mess with those
if you really know your stuff.

Motorolla is really my favorite CPU. But, Intel's are more bang for the
buck so I go with them. Also, Motorolla really needs to crank up the
clock speed and the Intel chips have excellent hardware support for
memory management and multitasking. If only so many were not saddled
with DOS and sorry PC motherboards.

Oh what I'd do for a VME-crate with a 68040 running UNIX, an i860 for
grins, and a killer DSP board.

Ari Feldman (ari2550@delphi.com) wrote:

: As others have said many times in the past on the net - the MC680x0 series
: has always been somewhat faster and more effiecent that the Intel 80x86 line.

But not the 386 on up in native mode. The 680X0's have a more elegant
instruction set, more registers, and little hardware support for memory
management (esp virtual) and multitasking. The Intel's have few GP
registers, very strict command set (i.e. non-elegant), and excellent
hardware support for virtual memory and multiasking. Different world's,
both pretty good. Basically Intel wanted to create the equivalent of
a mainframe on a chip. Motorolla figured they'd leave out hardware
support and make an instruction set so elegant programmers would be
willing to do it all in software.

: Part of this is due to the design concepts of the architectures - the Intel
: chips aren't fully optimized as they have to remain backwards compatible
: with that screwy 1970's 8086 segmented architecture.

You can fix that by not running a real-mode OS.

: The Motorola stuff
: takes a fresh approach and uses a "flat memory" model - no nasty segmentation.

Segmentation is NOT nasty. It's probably one of the best methods of
memory protection in multiuser/multitasking operating systems. It's one
reason writing such an OS on a Motorolla takes more work because you have
to do all that protection in software. Look at Multics which used
segmentation on purpose, not because they were forced to. I've got
several OS design books and most of them address this issue and that
the problem is the size of segments in some systems which were too
small to run large programs in.

It's also worth noting that the linear Motorollas had page-size limits,
segmented MMU's (on some machines), and other memory limitations.

The problem with early Intel segmentation was NOT because they had it
but rather because the segments were too SMALL. Most Motorolla OS
BTW use segmented architecture. It's simply a very good way to
organize memory/processes.

: The 030 is plenty fast from what I've heard and seen. The reasons for the
: Falcon's apparently sluggishness stems from its congested memory-bus and a
: TOS that is hardly optimized.

That's true. I also used to hate it because TOS was in ROM and was thus
quite slow. I realize it saved RAM but I don't care about that so much

anymore. I've got 20 megs on my UNIX box.

: PCs use graphic cards with their own RAM -
: this allows their CPUs to perform instructions while still updating RAM, while
: the Falcon has to handle the screen from its own RAM store - this again slows
: things down.

Well, they could have used dual-port RAM and provided an on-board video
coprocessor. In fact, I thought they DID. Is it just not very good or
did Atari not advance over the first ST's much in that area? I remember
GLUE on my ST but not much else.

I'd think Atari could have stuck an S3 accelerator in there somewhere
and really gotten great graphics speed.

I seriously doubt that Atari would release the rights to TOS. A recently developed emulator in the TI 99/4a world did a similar thing (remember that TI quit making the 99/4A in 1983) and TI has asked him to stop distributing their ROM/GROM code. It is available for license, though.

Since Atari is still manufacturing the ST/TT/Falcon line, they would never give the OS away. Most likely, they would require a license deal or actually sell the ROMS to the cloner.

This is valid if you copy the code. If you reverse engineer it for emulation
purposes ie just make it do the same thing butnot in the same way, then I
think you're chances are better. there are PD versions of DOS on the PC and
no-one has been sued AFAIK.

>pisses on it to mark it out, then walks away.

No, HE DOES NOT WALK AWAY.

This is not the only group he continually pesters. He has posted on all
the atari groups, as well as the amiga groups. He constantly quotes prices
of Macs and advocates that everything not labelled "Mac" or "Apple" is
crap.

He comes to these groups because they support something other than
Macintosh. The groups he continually posts to are groups related to
companies that sell computers other than Macintosh.

>He will return, you people have
>insured it.

He returns only because he doesn't have a life and this group is related to
a company that has a computer format in competition with Macintosh. Rest
assured that, if 3DO came out with a computer to compete with the Mac, he
would be posting in the 3do group as well.

I think it is amazing that there are Atari clones out there.

I also think the production of the Medua and the licensing of Falcon
OSes to manufacturers points out that Atari computers have a lot of support.

Source record: 16000

: I played with a new PPC Quadra the other day. $7500 machine, top of the
: line juding by price and associated Apple Hype/Propaganda. I had to
: laugh when it's video performance was nowhere near as good as my $70
: 32-bit S3 accelerator. The 20" RasterOps display was nice though.
: Tasking sucked. I could never do my work on one, it's just not capable
: of it. If only Apple would get UNIX running on it. Might make a nice
: workstations but then... a Sparc, HP, DEC, etc. would blow it's doors
: off so why bother?

The problem with the PPC today is not the Hardware so much as it is the software. These 'C' programs were ported from PC and 68xxx chips. They do not take any advantage of the PPC coding or registers. 'C' like BASIC or PASCAL is a memory intensive program. It does not use many registers, just memory. On the PPC with 64 64-bit registers, it might be adventagous to write 'just the intensive parts' in Assembly, making full use of the PPCs design. Then we would notice some performance. The PC is designed as a memory (now hard drive) computer. With only 8 general registers (which in real mode is not general at all) you need to access memory for everything.

The 'C's, BASICS, and PASCALS, make use of memory which is the strong point of the PC. The PPC can access memory at about the same speed, so there is no gain. Its the way software is written that will kill the PPCs performance not the PPC itself. We have just gotten used to bloated, poor performing code. :(

Vince

PS The advantage of the atari is mostly Thin coding. :)

millert@grad.csee.usf.edu (Timothy Miller) writes:

>That's your problem, not mine.

No, as per the purpose of this group you should be defending the Atari. That's you problem. Mine is attacking it.

>WHAT? What speed flaw? Do you have any CLUE about what SpeedoGDOS is?
>It referrs to the type of font it uses: Bitstream Speedo fonts.
>SpeedoGDOS doesn't correct any flaws. It's bart of the Operating System.

I thought the point of SpeedoGDOS was to make drawing fonts to the screen faster. I'm sorry if I was wrong.

>Some of the space that System 7 requires is useful. Most of it is wasted
>space.

System 7 has more features than TOS. Sure, System 7 could take less space but I would rather buy the disk/RAM than lose features.

>This is crap. C is designed to make it easier to produce efficient
>object code. Pascal was designed by someone who wanted to teach
>programming, so he made a programming language that favored structure
>over efficiency.

What you say about Pascal is true. C was designed to have as little baggage as possible. C has designed to avoid build-in I/O features and transcendental functions. That was a requirement since the the Unix system Ken Thompson was using allowed a maximum of 64K for both instruction and data. My Pascal compiler uses over half of that just for the build in features. The smallest C program my compiler can produce is less than 4K which includes loading the code, initializing the toolbox and quiting cleanly.

>Didn't you ever learn about this basic stuff in school?

Yes, didn't you?

>: goes. A pascal compiler does not have to worry about functions that
>: can accept an indeterminant number of parameters.

>Actually, it's worse, because it has to worry about functions that don't
>have a pre-determined arrangement of parameters. For example, write,
>writeln, read, readln... and any other such function.

The user cannot define fuctions without pre-determined arragements of paramaters. Any compiler worth a thing will treat writeln, write, readln, read and concat (I think that's all of them) as exceptions.

>In C, it's specified explicity. In Pascal, it's specified implicitly and
>you have less control. The same stuff is done; same net effect.

That expressive power makes it harder for the compiler to optimize the
code. Which do you thing is easier to optimize:

```
for somevar := something to somethingelse do
begin
something
end
```

or

```
for (some expression;some expression;some expression) {
something}
```

>C had a goto. If you don't know that, you shouldn't be comparing the
>languages.

I said it was possibly in pascal not that it was impossible in C.

>You REALLY don't know what you're talking about. C and C++ are NOT the
>same. I'm comparing C to Pascal and you throw in C++. Nice try, but
>it's not going to work. Any idiot knows an object oriented compiler
>can't predict ahead of time which inherited objects are going to be used
>and which aren't. When one class is based on another, it has to take the
>entire inherited class, whether it's used or not.

My point was simply that the finder was faster and that Apple was willing
to sacrifice run-time efficiency for maintainability.

>: The MacOS was originally written
>: in Pascal but most has been rewritten in C.

>I doubt it. Apple doesn't care that much about efficiency to want to
>even improve OLD code written in Pascal, let alone rewrite it in C.

I doubt that they did it for efficiency reasons as well. They did it
because C is the language of the futur and Pascal is the language of
the past.

>Windows isn't something to compare against. It's even worse. The 680x0
>is a great processor, but the Mac hardware and OS ruins it. The 80x86 is
>a horrible processor and Windows makes it even worse.

OK, so Windows is worst than System 7. I'm glad to here you say that. Now
heres my problem: I can chose a platform with lots of software, fast
processors and good support or I can choose a computer with a fast operating
system with good multitasking. Well, I want to run a lot of software,
Windows sucks, I want a fast processor and cooperative multitasking is
good enough for now. Which computer should I choose?

>: I have an ST and a mac. Falcon for the ST cost me more than Hornet for the
>: mac and Hornet is far better than Falcon. Which platform is screwing me?

>So, you pick out ONE piece of software where you get a better price. Big
>deal. I'm sure Atari users could give you reams of prices that are
>better for Atari's.

Give me a good Atari flight simulator (better than Hornet) that's cheap.
Also, since I time of games quickly, give me ten new games that are due
to be release for the Atari in the next three months.

>My Atari doesn't get in the way of what I want to do, while the Apple
>does. I get work done faster on an Atari than I can on a Mac. Sounds
>like the Atari's GUI is better designed.

You are not qualifying your statements. Tell me HOW the Mac gets in the way.

>I'm not debating that. You can like a Mac all you want. Just don't go
>telling how stupid my Atari is and how I should get a Mac. You shouldn't
>even be in this newsgroup.

I'm not saying the Atari is stupid. When did I say that? And the point of this
group is to 'attack and defend Atari computers'. Even if I did say that the
Atari is stupid wouldn't that be consistent with the purpose of this group?

>I'm surprised that you CAN digitize video. How much did the extra
>equipment cost you?

Just my stock computer. Btw, I did do this test with a falcon owner. The
compression on my computer was over twice as fast.

>Sorry is right. Sorry piece of crap Mac.

You hacked on be because you thought I said that the Atari was stupid.
Apparently you have two sets of acceptable conduct. One for yourself and
one for everyone else.

In article <3315kp$cil@mother.usf.edu>, millert@grad.csee.usf.edu (Timothy Miller) writes:

When heavily burdened by the Mac's OS, it no longer has that speed advantage over the Mac, but it has much better hardware. A 68030-32 in a TT running the Mac OS may not be faster than a 68040-33 Mac, but a 68030-32 TT running the Mac OS is certainly much faster than a 68030-32 Mac.
==========

I have many many many hours on a TT, [4 meg ST RAM, 4 Meg TT RAM] working with a completely RAM-based database. I do things on it that require significant amounts of time to do. (very sophisticated sorts, searches, and manipulations) Some of these things take a very long time to do. I would have to say that it is NOT faster than a 33 MHz 040 Mac. I have a great deal of time on Macs, too and there IS NO GLARING DIFFERENCE IN EFFICIENCY! A 33 MHz 030 TT is about as fast as a 33 MHz 030 Mac. In much of the work that goes on, the OS is not involved. (at least, in the kind of time-consuming processing involved in database work.) As far as everyday things like word processing, where human interaction takes the forefront, the responisiveness of the Atari interface is about the same as that of the Mac. I have more than 4000 hours on a Mac and more than 1500 hours on a TT, so I know what I am talking about.

Those who keep popping up and saying 'my ST is faster than a PowerMac' are either
a) Massively inexperienced in Macintosh
b) Use applications which are 'minimalist'

b) Is rather more prevalent, since most people experience Macs in business or educational settings where they are saddled with horrendous software like Word or WordPerfect v2.1 (3.0 isn't so bad)

Give me a particular example. Nobody I've ever asked to give an example of
this has ever given me one. Give me *ONE* example of how the mac "does things
for you that you don't necessarily want done."

>Atari's are good machines. The manufacturer, on the other hand, can't
>support the machine. For this reason, I don't blame many people for
>switching machines.

Ataris *were* good machines IMHO. When the ST first came out, it was fast
and had a good OS. Even the TT was a decent machine. But Atari failed to
significantly improve the ST series either in terms of hardware or system
software. What could have been a very nice OS was destroyed by Atari's lack
of enforcement of programming and UI guidelines, and the slow pace of
development of GEM.

Could you, please, post the new version of the code so we can all verify
that there are no more errors?

- From what you say above, it looks like you didn't fix the reads from odd
addresses on the 486 for example.

- If the 486 has an external cache, the outer loop (1000) may cause all
but the first pass to read entirely out of cache memory.

- Why do you read 16 bit words in the first place? Try the same thing with
32 bit reads. That should put the 486 even further from the Falcon.
This was supposed to be a bus speed test, right?

Your results show the 486 to have only twice the memory bus speed of the
Falcon, which is not possible given the Falcon's horrible bus performance.

The Intel chip is not like the Motorla it does not change the speed to
use odd addressing. Debug PC code and you will see lots of asm code that
is byte bound.

: - If the 486 has an external cache, the outer loop (1000) may cause all
: but the first pass to read entirely out of cache memory.

That is great, but in real time applications there is no need to read the
same informaion more than once.

: - Why do you read 16 bit words in the first place? Try the same thing with
: 32 bit reads. That should put the 486 even further from the Falcon.
: This was supposed to be a bus speed test, right?

I am designing a program that uses word reads, plus I need to be in
protected mode to take full advantage of the 32 bit registers. I don't
have a lang. that has a DOS extender to push and pop me in and out of
protected mode for DOS calls.

: Your results show the 486 to have only twice the memory bus speed of the
: Falcon, which is not possible given the Falcon's horrible bus performance.

Don't forget about the Falcon catch (sp?). The Falcon is a 16bit 16mhz
BUS. If you read words there is no penalty. When reading longs is when
you lose speed. Also if the loop is small, it is contained in the catch,
so all intructions in there begin to run like a 32-bit bus machine. I
only use registers when looping and access memory only when I have to.

A good compiler should be able to optimize register usage for you. It should
also adjust instruction order for you for speed reasons. The IBM RS/6000
compiler can do this well. What you have to worry about is adjacent
dependant instructions. That can really slow things down and the programmer
has to worry about this.

>'C' like BASIC or
>PASCAL is a memory intensive program. It does not use many registers, just
>memory. On the PPC with 64 64-bit registers, it might be adventagous to

>memory (now hard drive) computer. With only 8 general registers (which in
>real mode is not general at all) you need to access memory for everything.

A compiler can put variables in registers if it wants or you can request
it explicitly by using the 'register' directive in your variable declaration.
The PPC has 32 32-bit GPR registers, 32 64-bit FPR registers, 1 FPSCR, 1 CR,
and the rest of SPR registers (refer to chapter two of MPC601UM/AD). Since
the size of the registers is based on the size of the GPRs the PPC has
32-bit registers. Programming in 601 assembly is hard. I would not recommend
it for anything but the most time critical code.

>The 'C's, BASICS, and PASCALS, make use of memory which is the strong
>point of the PC. The PPC can access memory at about the same speed, so
>there is no gain. Its the way software is written that will kill the
>PPCs performance not the PPC itself. We have just gotten used to
>bloated, poor performing code. :(

All computers make the most use of memory or their hard disks. The PPC actually
has a big advantage when dealing with algorithmic code and medium size
data structures do to the large amount of L2 cache that is normally installed.

Ataris *still* are good machines for many purposes. Not everyone needs all
those extra *features* that System 7 and Windows offers. For using my
Ataris at home I prefer the simple, but effecient and built-in TOS.

I use a Mac IIcx at work and I really don't have a clue what it is doing with
over 2 Meg for the system. I guess I need all those extras for some reason
but I just don't get any thrill out of using the system to get things done
(well it is work, after all).

At home I have a Mega, a Falcon, and I am just now setting up a 386 system
to expand my computing horizons. Windows does have a lot of bells and
whistles, but do I really need them and do they need to be in such an
awkward UI? Again, I prefer the simple and effecient TOS and when I do
need some extras I can add it with a CPX or ACC or Auto prg.

I will have to agree, though, that Atari has fallen far far behind in
the software department. It is just amazing how much variety of software
is out there for the clones (and Macs too I guess). How can the handful
of independant developers even come close to competing against the massive
number of software 'houses' developing for those other systems. Of course
you are going to have more feature rich (note I didn't say better) softs
coming out of a *team* of well paid programmers. It is just a shame
that the Ataris couldn't have kept more developers fed as I still feel
it is a superior hardware platform (other than being somewhat closed)
and if more teams of programmers would have spent more time developing the
software, it would be better than anything done on those other machines
(actually there are a few examples of this, such as Calamus SL).

Oh well, I plan to continue using my Ataris for awhile cause they still
get the job done for me (simple home user/hacker). I'll also enjoy having
the 386 (or upgrade) around for playing a few Wing Commander/X-wing type

games.

My point was that you said your new test program ran the loop a thousand
times and then divided the time taken by 1000. If your machine had 64k
or more of external cache (not unusual), the last 999 iterations of the
loop would read straight from cache. The timing of the first iteration, the
interesting one, could be very far from the average timing in that case.

>I am designing a program that uses word reads, plus I need to be in

OK, I just want to mention that the test routines do not show anything
about the bus speeds in general of the two machines.

>Don't forget about the Falcon catch (sp?). The Falcon is a 16bit 16mhz
>BUS. If you read words there is no penalty. When reading longs is when
>you lose speed. Also if the loop is small, it is contained in the catch,

Unfortunately this is not true (I would've been very happy if it was).

First, there is nothing very 16MHz about the Falcon bus. The processor
runs on a 16MHz clock, but every bus access takes around 5 clock cycles.
(The 68000 in a normal ST can read a 16 bit word in 4 cycles, which means
that the Falcon's bus speed is less than twice that of the ST.)

Normally a random bus access should take 3 cycles on an '030 (if memory
serves me right) and the caches should be filled using burst-mode, which
is even faster. Unfortunately the '030 in the Falcon can not use burst mode.

There should not be any difference between the time taken to read a single 32 bit and a single 16 bit word on the Falcon, since a whole cache line (16 bytes) has to be filled in either case. If you're reading a lot of consecutive memory locations, the 16 bit reads will of course be faster than the same number of 32 bit reads since the cache lines will not be updated as often.

Odd then, is my case.

I had a Mac Classic, which I used at home. I went to work at a place that used Mega STes and TTs. I found the Atari machines to be *much* less responsive than my 8 MHz Mac. And these were at least twice as fast in clock speed! BTW, I was running System 7, too. I submit that it all depends on what one is more used to. When you use a certain computer, you get so that you expect certain things to happen at certain speeds. Even to this day, with over 1500 hours spent in front of an Atari, I am *amazed* at how long it takes them to format, read, and write floppy disks. I am *astounded* at how many steps one must go through to move files from folder to folder. Atari people probably have similar problems when dealing with Macs. It all depends on what one is used to.

Aloha Atari Lovers and Bashers,
Just wanted to say that I am the occasonal computer user who
finds his ancient Atari 1040STE perfect for the type of applications
I run.
I am the kind of user who doesn't sit around saving every nickle and
dime I make just to get the latest and greatest speed demond computer in order
to keep up with the Jones nextdoor. I have less than $1,000.00 tied up in
my computer, yet I'm able to do Semi professonial DTP projects, Professional
quality midi presentations, and have hours of nearly free fun and entertainment.Also, I can
do many things on my ST in less time than many of my 486DX using
friends with an ancient system that only runs at 8mhz. I really don't think
it's the hardware people...and in many cases it's not the software. Computers,
any way you look at it are dumb...the final product revolves around the user,
and the effictiveness at which he or she manages time and resources. It
really doesn't kill me that I have to wait a WHOLE 2 minutes for PageStream
to plot out and print a full color flyer that isn't due untill the end of
the week, because I know I can use that time to make an important phone call.
Also, it's not worth another $1,000.00 to me to gain that 2.5 minutes that
would otherwise be wasted if I weren't sitting at my desk waiting for the
page to be printed. All computers can be extremely powerful...I don't care
if it is merely an old TI35 calculator...after all...look what we achive
with a simple ink pen. Any purchase of any product can be a waste of time and
money, or can be the investment of a life time. It boils down to what you
do with it...what YOU do with it..not what Intel or Motorola or IBM or whoever
say you can do with it.
In my home town..there are two Local TV stations...one has every
high tech toy in the industry...the other is making off of technology left
over from the 60's. Funny how the one with backwoods technology still
manages to produce the best and most watched news program in the area. They
do it with people, not tech toys...
For those of you who professionaly write, design, and evaluate
computers and software...I tip my hat...you guys should be fighting over
superior platforms, languages...etc...that's your job...to fight for
the best possible performance per dollar ratio, but you guys who do nothing
but watch the windows hop around on your screen and never really DO WORK
because your system isn't fast enough...QUIT MAKING EXCUSES and get productive!
My ST is just fine for what I do....and it's cheap...so quit calling
me and other ATARI users Idiots for not wasting our money on a Mac, or IBM/Clone...This
crappy old STE earns me at least one week in Europe a year...Can you
say that? Maybe you just need a faster computer, then you'll be able to
get your job done (right).

Brian

3463. What computer should I buy?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-08-22 05:00:52 UTC

I considered purchasing an Amiga but somebody told me Commodore was no more.
So I thought a Macintosh but some fella told me the OS sucks big time.
Atari had good music software but looks damn ugly.
PCs, well...yer can't format floppies in the background.

I would get some new info on PC's. There are several options to make
PC's a pretty good computer.

Several different flavours of operating systems, lots of new hardware for
video capture, accelerated 3D graphics, wide range of sound cards and all
sorts of stuff.

The good thing is that there are lots of companies competing to make
these things, so they just get cheaper and cheaper and better an.......

The days of the ugly, ISA 640K DOS box is gone.

But who know maybe you will like a mac or a PPC from IBM who knows go
check it out yourself. Dont listen idiots like me or anyone else in this
group for that matter.

Peace, Love and cross platform computing.

:)

Video Toaster,no. But did you consider the fact that he may not want
one? Maybe he does not give a damn about 30fps.

Incidently, 30fps? How about the 35 or so video capture and playback
cards coming out for the PC. 35 might be to small. Almost all VGA cards
come with AVI enhancement features.

Though I still like the amiga, the above argument is even shaky for the
toaster as LW is being released for the PC.

Very subjective. It's strange that when you see TV shows with people using computers creatively i.e. video artists, they are almost always using Macs.

> Atari had good music software but looks damn ugly.

Agreed. ;-) (Smiley to stop getting flammed by Musos)

> PCs, well...yer can't format floppies in the background.

Depends what OS you use. Take either OS/2 or a Unix clone and you can.

<laughs like ALF>

I've yet to see VIDEO art on TV that matches the work of the demoscene,
frankly, their all too frequent use of standard paint-box effects come
out as pretty pathetic. And where is the artwork? Geez, most of it has
the garish look of 80s scenestuff. "they are almost always using Macs",
please, spare us.

: > PCs, well...yer can't format floppies in the background.

: Depends what OS you use. Take either OS/2 or a Unix clone and you can.

And what great apps are available for those OSs?

If all he wants is a decent computer (ie not a setup with all the
"best" apps), well, to hell with Mac and PC, get a workstation.

Don't.. they are NOT cheap.... (in any sence of the word)
preformated flopys are a hier grade than non-preformated...
(atleast they are better tested)
anyway you can format flopys in the backgound on a PC using concurent
Pc Format... or any multytasking software/envirment on the PC...

You want cheap? I got cheap... by the way.. don't buy cheap flopys
unless you know what your doing.....

or are a good disk ninga (Throwing dead disks around like throwing stars)

Some cheap disk resellers or sellers sell dead disks.... you have to know
how to tell just from the pricing wether or not it's a scam...
(even then it's hard to tell)

This depends entirely on the floppy disk manufacturer. At Stanford,
the Bookstore at one time sold Dysan preformatted disks that wasn't
quite formatted correctly. Mind you, there was nothing wrong with the
medium; they worked fine if they were reformatted. Unfortunately, a lot
of people reportedly lost data with these disks since, well, you don't
buy preformatted disks so that you can reformat them.

What will you be using it for? Will you need compatibility with computers
at work, and if so, how much compatibility (do you need to use the same
programs, or just work on the files)? For music, the
Atari is an excellent way to go; it is the music industry's computer of
choice for MIDI editing/sequencing/etc. If you need to do commercial
quality animations, then the Video Toaster is the way to go (which is just
an Amiga with some extras), though the Macs have some of the best video
editing hardware and software around (60fps, and mulots of money). If you
need to use specific PC programs, then go with a PC. For anything else, I'd
recommend a Mac. The OS doesn't suck all that much anymore, and though
it isn't as fast as I'd like for some things (it is huge), it's not nearly
as bad as Microsoft's DOS/Windows combo.

The Macs have several nice features:
-Standardized interface, so all programs look and feel the same; once
you've learned one Mac program, the others are easy to learn, something
which isn't true on any other system.
-Ability to read from and write to PC formatted disks, so you can use files
from a PC on your Mac (finish reports, etc.)
-True "Plug-and-Play" architecture. To add any peripheral - CD-ROM, modem,
printer, etc. - just plug it in, run the installer for the software, and
you're ready to go. On a PC, you have to add boards inside your machine
and spend time configuring the software. Adding peripherals on a Mac
requires far less time and expertise than with any other system.
-A completely Graphical User Interface; what you see is what you get
(WYSIWYG), and to select something, just click on it with the mouse. With
the PCs, lots of features are still very much like DOS, even when you're
running windows. On a Mac, when you want to delete a file, just use the
mouse to drag the file to the trash, and when you want to copy or move a
file, just drag it to the new location. On a PC, to do either of these
things you either have to be in DOS and remember all the commands and the

full path names, or run a program called the File Manager; several extra steps and a whole lot more complexity than with a Mac.

In my experience (I sell Macs), most people who have used both Macs and PCs like the Macs far more, and always prefer buying them. The only time I have ever seen people buy PC rather than Mac is either:
1) They have a specific IBM compatible-only program which they *must* use.
2) They have never used Macs (and usually never used Windows, either).
I own an Atari MegaSTE, which next to the TT030 was the nicest computer that Atari ever built, and it works great, but the market is dwindling (another magazine folded just recently), and good application software for word processing is becomming scarce, though for DTP, graphics, MIDI, utilities, and telecommunications, some of the best software I've seen is available on the Atari, and still supported and updated.

I will be switching in a year to a PowerMac. I feel that the Atari will support my needs about that long, and the PowerMac architecture is the way to go for a new computer purchase. The PC world lags far behind Apple for ease of use and user friendliness, and I don't see that changing anytime soon. I have an extreme dislike for DOS/Windows, as I find it cumbersome and poorly designed; I don't think Bill Gates has made his software engineers work very hard for their money in producing new versions of those two programs. Also, the PC world is still working to catch up to Apple's design standards; "plug-and-play" is becomming a buzword as "the new thing" in PCs, though Macintosh has always had that design, and the next incarnation of Windows (v4.0, called Chicago) will just be a poor imitation of System 7.0.1P on the Macintosh. If you buy a PC now, you will be buying either a Mac wanna-be that is years from catching up, or a UNIX or OS2 platform (and if that suits your needs, then go with it).

If you compare the quality of machines, service, customer support, and features built into the computers, you will also find that Macs cost less than PCs. Of course, you can get PCs that cost less, but they have little or no support, and are likely to break at least once a year. The only machine I know of which is definitely comparable to a Mac is Compaq's line of computers; they too offer good customer support and quality components. Let me give you an idea of the hidden costs of a Compaq (or any PC). I will compare a Performa Mac (sold in retail stores) to a similar Compaq.

Feature ($1499)Mac |($1099) Compaq

8-bit stereo sound built in | add $100 + $40
.28 Monitor built in | add $260
networking built in | add $70
read/write both Mac
and IBM disks built in | add $150
software built in | built in
plug and play yes | no
set up time ~15 min | ~ 50 min

==========
Total $1499 | $1719

The $40 added to the sound is to have a technician add it in so you don't void your warranty. Of course, adding the networking and replacing the disk drive to read Mac disks will also cost tech time, so the price may go up even further. And of course, the Mac still has advantages that no amount of money can give the Compaq (or any PC).

The only advantage PCs have is the incredible amount of cheap (cheap price and cheap quality) software; there is more software available for under $15 than for the Mac, but lots of it barely works, so this isn't a big plus.

In my opinion, unless you need to meet one of the conditions I stated above, the Macintosh is the way to go; it is easy to use, easy to set up, easy to upgrade, easy to learn, has good customer support, is made with quality parts, and has a good warranty. And of course, most good software is available for both Macs and PCs.

I hope this helps you some, and if you have any other questions, let me know. The bottom line, though, is that you need to decide exactly what you will be using the computer for, and then go out and see what's available, get your hands on some machines, and decide what you like using best for yourself.

Regards,
Tom

No, I've used and sold Dysan, and I will state for the record that Dysan
disks are crap. I've used lots of them, and formatted each one on my
computer, and within 6 months over half have gone bad. The same is true
with other people I know who have used them (and formatted them) on their
systems; it doesn't make any difference which system you use, if you use
Dysan, expect to lose your data.

They're also the only personal computer that can do 60fps, full screen
video editing (as of last month, anyway ;-). If you have the cash to
spend and don't want to pay for workstation, the Macs are a good way to go.

>> L2

> A *motherboard*, yes. A separate processor card, no.

Now you have me really confused on two points:

- Are you suggesting that a system should be designed as a *single*, standardized processor card plugging into *different* motherboards?
- I suspect that the PA-RISC wouldn't be happy about the CPU-L2 connections crossing board boundaries (I've seen reports that the 686 will have CPu and L2 as two chips in the same *package* even).

>>> This whole concept of a base architecture you can just plug things into was
>>> to be the Amiga's future, if Dave Haynie's comments are any indication.
>>
>> There are lots of things that should't change for different processors (and

>> not IMHO among them.

> That's it, though. The main board need not change. Define a standard
> interface to a CPU card, and build the rest of the computer system around it.

Just above, you suggested that the L2 cache, which definitely has to be different for the PA-RISC than for the 040, should be on the motherboard. Aren't you contradicting yourself here?

> Of course, skimp on the design, and you'll get an A4000, but there's no
> reason why you couldn't support 040/060 and PA7100/7200 well.

... other than that it wouldn't be economic for anything like the high
production volumes that a revived Amiga line should acheive to be viable.

I beg you pardon?

I sat down in an edit session with a Digital Broadcaster32 (60fps,
interlaced, overscanned, JPEG compressed video) a couple of months
before my local Avid pundit recieved his 60 fps upgrade for his Media
Suite Pro. The aoutput quality I've seen from the Amiga based DB32
surpasses by a decent amount, what I have seen coming out of the Avid
Media Suite Pro, both in JPEG artifacting, and in analog video qaulity
(the DB32 was going component to a betacam deck, while the Avid was
using only Y/C separtation).

As to MAcs being used for television graphics, I don't know of any of
the 6 decent sized television stations (not counting the LPs that are
always shopping channels) in my ADI, I have not seen MAcs ANYWHERE in
there studios. All those that do in house production use dedicated
video systems (most built around Intel architecture with Custom OS/s
hardware and such to the point that it can not be considered an intel
based PC) and/or Toaster systems (only one uses Toasters exclusively,
and only one doesn't have a Toaster).

Be seeing you...

Hmmm not true. First off, I think you meant 60 fields-per-second, rather
than fps, which is frames-per-second. A field and a frame are two different
things, 1 frame = 2 fields, which is how NTSC video works, and therefore,
even the $100,000 AVIDs are only 30fps, though they can handle 60 fields
per second.
Secondly, the Vlab Motion and the DPS PAR are both currently available,
and offer video quality comparable to the $20,000 Media 100, though they
both cost under
$5,000, including the board and the hard drive. It seems that amiga has
the mac beat for price/performance in the digital video realm, and you
can expect this to continue when the video toaster Flyer is released. In
any case, the DPS PAR handles 60 fields, maximum NTSC resolution, and
outputs a betacam quality signal (you can check this on a waveform
monitor, it's REALLY clean), and it costs about $3500 fully stacked with
a 1.7 gig drive. The Vlab motion has similar specs, and includes a full
screen editing software with sound as well. The top-of-the-line Media 100
and Avids both falter when it comes to meeting these specs, and they
cost over 10 times as much. If you doubt this, get yourself a waveform
monitor and look at the output signals. That's the only real way to get
out from under the mountain of macintosh hype about nonlinear and see the
reality that they are overpriced and under-performing.

Didn't mean to ruffle your feathers, Ed. ;-)

I didn't claim to have the divine skinny on the PC market, but my main points still stand.

1) Figure out what you *need*, then go out and check out what will meet those needs, regardless of what anyone else says.
2) Macs are generally easier to use than DOS/Windows, and offer prices that are as good or better, given quality, features, warranty, and service.
3) Most people I've talked to who use both Macs and DOS/Windows on a regular basis find the Mac interface easier to use than either DOS or Windows (unless they're already adept at DOS).
4) Cheaper PCs offer more features and speed than a comparably priced Mac, but usually sacrifice service and quality in the process (notably Leading Edge and Packard Bell, which offer lots for your money, but are prone to breakdowns). Not all inexpensive PCs are crap, however.

Hope you find the computer that's right for you.

```
: Feature ($1499)Mac |($1099) Compaq
: ----------------------------------------------------
: 8-bit stereo sound built in | add $100 + $40
: .28 Monitor built in | add $260
: networking built in | add $70
: read/write both Mac
: and IBM disks built in | add $150
: software built in | built in
: plug and play yes | no
: set up time ~15 min | ~ 50 min
: ====================================================
: Total $1499 | $1719
```

You forgot to mention that the stereo card on the Compaq is 16 bit and comes with joystick, midi and SCSI interface for CD ROM.

```
: imitation of System 7.0.1P on the Macintosh. If you buy a PC now, you
: will be buying either a Mac wanna-be that is years from catching up, or a
: UNIX or OS2 platform (and if that suits your needs, then go with it).
```

This is so misleading it almost invalidates the entire argument.

There are also quite a few PC compatables from other manufacturers that exceed the Mac's price performance by a long shot.

And that's another important point, Commodore fans: PCs are available from all sorts of companies, configurable to your own specifications. Mac programs are easy to use because of rigid participation in their "look and feel" specifications. But for non desktop publishing apps like 3D animation, the programs are harder to use because of adherance to an inappropriate standard.

Lightwave will be flamed to death on the Mac, I guarantee it.

There are numerous Windows shells, my preference on the PC is the one from Norton. I'd hate to program on PCs, but from a user standpoint, I can get far better performance on a PC, it is easier to customize, set up macros, etc.

Last, you have choices in networking, a huge number of graphics cards which range from utilitarian to high end approaching SGI performance, and there is a design to run MIPS chips on a Pentium motherboard (MIPS chips are the ones in SGIs).

Also, try to upgrade a Mac by buying a new motherboard with the day's hottest chip.

: If you compare the quality of machines, service, customer support, and
: features built into the computers, you will also find that Macs cost less
: than PCs. Of course, you can get PCs that cost less, but they have
: little or no support, and are likely to break at least once a year. The only

Flame bait!

I prefer the freedom of choice on PCs to Big Daddy Apple telling me what
I can and can't have. Like a 2 or 3 button mouse. Or an interface
designed to optimize the performance of the program at hand. Or the
latest cutting edge accessories. I will sacrifice ease of use and ease of
installation for ease of customization.

Your choice of platform is not always a black and white issue. The things
that favor a MAC can also be looked at as disadvantages under the right
circumstances. As an ex-Amiga user, I found the MAC intolerable and
inflexible.

This is the most important thing. Figure out what you want to do with the computer and then figure out what software will accomplish that goal, and then figure out what your hardware requirements are. It's really quite simple.

>2) Macs are generally easier to use than DOS/Windows, and offer prices that
> are as good or better, given quality, features, warranty, and service.

Mac's seem easier to me to use on a general level, but they are more difficult for a computer veteran to use because they assume everybody is equally stupid. I don't like them, but I do recommend them to everybody I know who just wants to use a computer at home and doesn't have the time to learn about editing config files by hand.

Although while Mac's are coming down in price considerably, they are still more expensive then their PC counterparts.

>3) Most people I've talked to who use both Macs and DOS/Windows on a
> regular basis find the Mac interface easier to use than either DOS or
> Windows (unless they're already adept at DOS).

Agreed. I don't find the Windows interface easy to use at all, and I'm adept at DOS, X, Unix, AmigaDOS, CP/M, etc. It's too strange for me, OS/2 was easier than Windows, but the Mac is just plain easiest of all. :)

Well Leading Edge used to not be all that bad. Packard Bell is crap. Personally if your going to buy a PC I'd suggest Gateway, Dell, Micron, or perhaps if you are ambitious do it yourself.

>Hope you find the computer that's right for you.

Yeah, and one thing... Don't listen to what your friends say. Well unless they are intelligent or something. It's funny how a lot of times people will identify something as crap just based on what their friends say.

Actually there was a study done on this at some company. They were trying
out spreadsheets or something like that and found that if one vocal person
kept complaining about it, the entire group would have a negative opinion of
it. I can probably find a reference for this if anybody wants it, I think
it was mentioned in the latest Unixworld(Open Systems Computing, whatever)

[shrug] I dunno. Different "brands" of bulk disks maybe. The 6 year
figure is true. The only exception were a bunch of disks that got
formatted on an Atari ST. Afterwards they were unreliable on a Mac, and
on a PC as well. I have seen this with name brands as well.

: Didn't mean to ruffle your feathers, Ed. ;-)

No prob, but being a PC user spending a bit of time around
comp.sys.mac.advocacy, I've found that there are many misconceptions
about the PC.

: I didn't claim to have the divine skinny on the PC market, but my main
: points still stand.

: 1) Figure out what you *need*, then go out and check out what will meet
: those needs, regardless of what anyone else says.

True, but if that's you're #1 point, why are you influencing
people away from PCs?

: 2) Macs are generally easier to use than DOS/Windows, and offer prices that
: are as good or better, given quality, features, warranty, and service.

"Easier to use" is subjective for there are GUIs (depending
on what you need) for the PC that will win kudos over System 7. As for
price/quality, buy from a good PC distributor and you will get a better
price for an equally stacked machine and just as good support. On all
the price wars here on c.s.m.a., I have yet to see a good Mac price that
I couldn't contest with a glimpse through Compuer Shopper.

: 3) Most people I've talked to who use both Macs and DOS/Windows on a
: regular basis find the Mac interface easier to use than either DOS or
: Windows (unless they're already adept at DOS).

True, for brand-new computer users System 7 is probably the
easiest to use, though I think OS/2 is right there also. But even for
new users, it's not hard to learn Windows... DOS can come later if the
user wants to learn it.

: 4) Cheaper PCs offer more features and speed than a comparably priced Mac,
: but usually sacrifice service and quality in the process (notably

: Leading Edge and Packard Bell, which offer lots for your money, but are
: prone to breakdowns). Not all inexpensive PCs are crap, however.

Looking for a PC a little research is involved. There are many
companies that have good quality products and excellent support, granted
there are also many companies that will give you a crap machine.

Buy an Amiga if you need to do advanced graphics and animation...

Buy a Mac if you want to be as isolated as possible from the technical workings of your computer and want to run some powerful apps....

Buy a PC if you want cheap hardware, lots of software, some form of a standard, and rather unfriendly OS (DOS) or cumbersome (Windoze).

Buy an Atari only if you like scrounging for the hardware and software you really need...even though this can be fun...

It's your choice!

True, Commodore is no more, but support for Commodore products still exists in large amounts... Actually Commodore is Liquidating, so it is still up in the air if the Amiga line of computers will be made anymore.. Personally, I hope the do continue it.. I am a PROUD owner of an Amiga, and wouldn't trade it for the world.. True, I would like to get an IBM, but I will NOT give up my amiga for it... Instead I am going to purchase an Emplant board which will give me Mac and IBM 486 DX emulations.

As far as the Mac goes, I don't know.. I have seen a Quadra, and they are impressive.. Mac has very nice programs, but other than that, I couldn't tell you... You might send mail to rufus@iglou.com he has an amiga 4000 running an emplant with Quadra emulation.... (Best of both worlds)

Oh.. One other word in favor of the Amiga... The Amiga is the only computer I have seen that can emulate ANY other computer there is... IBM, Mac, Apple, C-64....

Yes true, I did see a so called "amiga" emulator floating around for the pc,
but of course it never did work. And i can't se how it would for that
matter.

One more thing in the Amiga's Favor!, Disney Studios apparetly use Amigas
for most of the Animation work. I'm sure how true this is, but I have had
several sources. Also The amiga (and Mac) played a big part in Lawnmower Man
(the movie), and also in Jurrasic Park. If all these things are true, then
the amiga has a good grasp on the Animation world.

Anyway thats all for now.

What shits me worst than the ST's ugliness is the god damn freaking diamond shaped function keys. Were the hell did they get the designers from?

The St stinks big time. It's all but fizzled out in the dust of Amiga supremacy. We no longer compare our superior piece of hardware to the St anymore. The St was never any competition.

And besides...the interface sux too. Our Workbench 2/3 leaves it for dead!

Har Har!!!

It seem most of the people I know who are considering buying a computer tend to settle for a Clone.I personally wouldn't recommend a Clone unless you have a working knowledge of Dos or plan to learn it.
I started on an Amiga because the main reason I wanted a computer in 1986 was for graphics and games.The Amiga was the best choice then because there were Amiga stores all over and lots of great Amiga games and Art software.
I now own three computers,the one I enjoy most is my DX2 not because its the funnest but because I enjoy Fixing all of its little quirks.Example: to get games to run I am constantly battling for conventional memory.This is a major cause of games crashing.
If one doesn't like working with dos I strongly recommend not buying a Clone.If you do buy a clone be prepared to have problems with Windows setup.
The one good thing is there are lot of manuals available to help educate yourself on the various problems you my encounter.
I recommend a Mac if you don't know much about computers because they are the easiest to get to learn.
Super Tech.

There are more Computers on the market than Mac and IBM....

The Hidden cost list was rediculis...
IBMs do not natraly run Windows.... owning one dosn't mean you must run
windows...
Mac software is not superor to IBM software (as was segested)...
many times Mac software is inferror.... there are some expensive
pacage programs for IBM that are worthless by any standards they are not
the norm....

In the hidden cost list three things stand out
A moniter is usualy an extra cost for Macs as well as IBMs...
Only the Mac Classic and pacage IBMs have a moniter included...
A network (Lan) is only useful if your conecting the computer to many
other computers.... This can usualy be presumed NOT the case...
also the internal Lan on Macs (Apple Talk) is not very efective and
the user will have to get a Novel network controler....
(Another blunder is he said "$50" for IBM network... this is wrong...
that should read $150... Novel cards are not cheap)
Being able to read Mac disks is not useful sence Macs read/write IBM disks
and in order to have a Mac disk to read you have to have a Mac....
